With all these new 900mhz cordless phones on the market, how is the best way to find em on the scanner?
If you find one close do you figure that will be the same frequency each time they use it? Thanks for any input...900mhz buster...

3480. Re: 900 cordless freq's

some of those phones come up on same freq every time but from what i know they often change and come up on a random one...
i don't have a list of active freqs...but one was posted here just recently (last 2 weeks...)
easiest way to find em w/o list...sit and scan from high 800's to 920's///again...from what i know that is where they all transmit and receive!.....

Just one more reason to add a CE-232 or PROgramit interface to your
radio. Never need to manually enter frequencies again. You can
also purchase a frequency listing CD-ROM from Percon and eliminate the
need to enter the freqs into your database also.

Source record: 139205

Just so there is no mis-conceptions by certain people,
I will be leaving my ISP VERY SOON.

I have been saying I am going to do it for the last couple months.

Last night & tonight have been the final straw.

When I signed up
with MCI Internet 6 months ago I did it because I wanted an ISP
that would support my 56K/Flex modem and provide local (non 800)
service in my hometown of Sioux City, Iowa. (Sprint, previous ISP,
could not meet either of these requirements) MCI had local service in
Sioux City & stated they were going to support 56k/Flex very soon.

Service in Sioux City is fine, but MCI never did support my Flex modem.
Instead they went X2. So later I got a really good deal on a V.90/X2
USR Sportster & obtained one. But the quality of newsgroup service
never did improve no matter how many times they said it would. The
FASTEST I ever saw newsgroup downloads was 2.5K/sec, & it was usually
more like 1.5K. That SUCKS for simple text!!! Other ISP's can do
5.0K on a 28.8 connection.

Recently MCI was bought out by Cable & Wireless & service has gone down
just
in the last few weeks. Just while writing this post I have lost carrier
twice & had to re-connect. Last night service was off of about 4 hours.
Lately, I lose carrier about once a day & have to re-connect.

My advice to others: Stay away from Cable & Wireless (formerly MCI
Internet) because both the quality of service & tech support SUCK.
Lately, listing to scanners on realaudio has been impossible, just like
it was on Sprint before I left.

I will probably try AT&T or Concentric next. Maybe Sprynet even!

If you really believe that then why do you continue to harass me
& make up your outlandish stories such as your kicking me off of
a few fidonet echos?

> Prove it John. Marge has stated that you are incorrect, and she
> does not have any idea where you came up with it.

I have asked you to prove this by having Marge send her denial
directly to ME (not thru YOU) but you can never produce!

Blake my challenge to you to prove Marge's denial still stands. If
she is as stong as you claim about it then she would be willing to
state her denial directly to me. Instead, we only hear you claim
she told YOU (and no one else but you) of her denial!

> Nope John. I have no desire to see you infest yet another newsgroup.
> None of this had anything to do with HAM radio.

YOU were the one who started mentioning the ham radio related fido
echos. You want to avoid this spilling over into the ham radio
newsgroups because you know the hams on the internet are smart enough
to see thru your lies.

3486. Re: Decoding Digital Weather Data...

The stuff the TNCs decode is only the HF stuff that is similar to the
weather fax stuff, but is FSK.

The stuff that is AM (Actually a 2400hz tone amplitude modulated
but broadcast on an FM signal) and what might be determined as
FAX all is in the 136MHz area and direct from the polar orbiters.
I don't think any of the TNCs decode this, but I may be wrong.
If you want to hear this, although it won't be very usable due to
bandwidth limitations of most scanners, just listen to 136.5 and
136.7. This is actually I believe 'type 1 fax' but it doesn't have
start and stop headers, but does have the standard band for
alignment. (This was just the signal generated by the 'paper
clamp' on real fax machines in the early days.)

I'm not sure what would be on the VHF weather channels, unless
they are going to some digital alert signaling. Maybe it's just
background noise when they record their audio announcement
tapes?

Newsgroups will not go way of CB radios (which by the way are making a comeback oddly enough) because unlike CB you can filter out the information you don't want. I figure 75% of the newsgroup reading population doesn't filter and so there is this "perception" of a problem. But to those who do, newsgroups are as useful as they have always been. Also, newsgroups aren't necessarily meant to be read sequentially--as most of read them. If you consider services like Dejanews that can "find" threads based on keyword queries and years and years of newsgroup input, newsgroups represent the most powerful free-form knowledge-base ever developed. Spam doesn't interfere with that.

If you're depressed by the sludge of stuff moving through newsgroups, get a quality newsreader that has good filtering capabilities (Forte's Free Agent is currently the best), and make use of newsgroup search engines like Dejanews that allow you to research your question through millions of free-lance postings a year. AOL does not offer filtering based on user-defined keywords, but they have recently implemented a filtering scheme against spam that seems to work fairly well.
Finally, while I don't agree with the approach as long as we can personally filter, there are those working on a "second" newsgroup system that is based on topological accuracy and will use a moderated approach. I don't have the details on that system, but I know it's out there. They got some press last year.

>Sorry to burst your bubble, but the dream wideband portable
>is yet to come.
Actually the problem you describe is dealt with on the Yupiteru MVT9000 and AOR8200. A number of people, including Javiation sell a mod for the AOR 8000 to fix the problem, and reduce the AM bandwidth to 4Khz. The standard AM bandwidth on scanners is 12-16Khz, with a frankly not so hot shape factor. That's only half the battle. Scanners do not have tuned front ends. To be blunt, Image rejection, and IM overload products at the font end are a fact of life. Many of them can get the blocked cell bands almost as well as image as they could if they were unblocked! Fortunately few see these problems, the standard scanner antenna is just about deaf on HF. If you connect one to a decent antenna, the image and bandpass problems become intractable!

To make a long story short, you are basically correct, Scanners make lousy HF receivers. A YB400 or 7600G is an immensely better HF receiver than an scanner.

If you want a scanner that can do it all, you are talking about something along the lines of an ICOM R-8500. I counted 12 bandpass filters in the front end (according to the schematic)! That isn't portable, and it isn't price like a hand held scanner either.

: I'm dealing with multiple satellites of some sort.

Long time ago the Transit navigational satellites used the 150 MHz/400 MHz frequency pair in a Doppler navigational system. The two frequencies were used to compensate for ionospheric disturbances. The Soviet union had a similar system.

I thought that these were made obsolete by the GPS and Glonass systems, but who knows, maybe some satellites from the old system is still operational.

Yes Blake!!! I am not surprised!!!!! You have always lusted
for power & done ANYTHING you could do to try to make yourself
look better than me. LONG AFTER I left Fidonet you came
to a position where you were in control of the Fidonet echos you list
above & others. Then since I WAS NO LONGER ON FIDONET for several
months
you suddenly claimed that I had been kicked off of those Fido echos.

Funny how YOU are the only one who knew anything about this.

You had to wait until after I was off of FIDONET to do this because
you couldn't have pulled it off if I was still there!

> You keep bringing this up, stating that Marge had to
> take action against me, and neither Marge, or anyone else,

Yes, she did & as a result you were NOT on the echo for about 90 days.

Blake, you seem to want to discuss ham radio type of things
mentioning the ham radio echos of Fidonet. So I cross posted
this to the ham radio NG's. I suggest we continue this discussion
there.

Try setting the squelch up. If it's high enough, you won't have anything out of the ear phone jacket to set off the voc until there's something to record.

If your worried about what frequencies they'll outlaw next. Don't forget they (our congressmen) tried to introduce a bill to outlaw business freqs. unfortunately they are all over the band, Which would have pretty much made scanners useless. Don't know how far that bill got this year, heard it was getting modified for the good.
BTW, don't forget both the house and senate passed a bill out of committee, that the FBI was able to push(add) a section giving law enforcement the right to set up roving taps. They can tap your phone, cell phone, computers, email etc. an you don't have to be a law breaking suspect for them to do it. Pending Clintons' signing.

If anyone has any store security, loss prevention, assets protection, mall security, amusement park security, or other security frequencies that are not listed in books (ie: Police Call, METROSCAN, Scan Fan, Monitor America), please email them to me. I am trying to update my site and I have created a section for freq's, such as those I mentioned above. Of course you can send any freq's for me to post on my page, but I am in desperate need of security freq's right now. Thanks in advance.

3503. AR8200 Problem..

Newsgroup: rec.radio.scanner
Date: 1998-11-05 00:00:00 UTC
From: Victorian@EmergencyServices.Web.Site
Message-ID: <36419093.919521@news.netspace.net.au>
Source record: 139245
Cross-posted to: rec.radio.scanner,alt.radio.scanner,aus.radio.scanner,aus.radio.amateur.misc,alt.radio.scanner.uk

I received my AR8200 today (5/11/98). I have one problem with the radio. It does NOT receive anything at all. I have tried broadcast FM freqs, UHF right across the band, VHF, everything and it does not pick up a single freq. I have a few FM900's around and set one up to transmit on High Band VHF and keyed up and the scanner did not pick up a thing. I have owned an AR8000 so I know that they are not easy scanners to use. I have been using the correct mode for each freq, step size etc..
Its like there is no receive circuit working in the radio. Also every now and then it kept displaying PLL ERROR, and as there arent any of the hidden features that let you adjust it I don't really know whats wrong.

I would really appreciate any help you can give me.

David

As posted here four days ago ...
| You have the right idea, but a small problem. The "mic" input of the
| recorder is designed for the very low output of a microphone. The "line"
| and "headphone" outputs of a scanner are comparitively high level and will
| overdrive the recorder at any volume setting. The solution is an attenuator.
| Radio Shack sells a 40db attenuator/adapter (#264-300) for $3.49. It
| accepts an RCA plug and fits an 1/8" jack on the recorder, so you may need
| an additional adapter to match whatever cord/jack/plug you have. R.S. was
| also supposed to sell an attenuator cable with 1/8" plug & jack, but I've
| never been able to find it in the catalog.

What you need to do is adjust the volume lower to get a clearer sound. Do
a few test runs (use NOAA Wx Radio if equipped). If it still sound
distored, just keep lowering the volume until you get a clear sound.

During severe weather, seconds can save lives!
Buy a NOAA Weather radio to keep you and your family ahead of the storm.
They should be as common as smoke detectors in all homes and public places.

For more information (and other good links), please go to:
http://members.theglobe.com/kit%20cannon/default.html

I feel sorry for you that your freedom to legaly listen to a radio has been
taken. write to governer ventura,maybe he can
help with the state law outlawing scanners.
you can write to your congressman on the govt level. and ask them why listening
to an old police scanner is outlawed&are scramblers going to be used in
new scanners to blockout cel phones etc.. can you handle
the truth? . they survive off of" you" by outlawing
something. and making an inocent
person part of the system. guns,radios,where will
it stop? . ,
this is a violation of our constitution,.
our forefathers came here to escape corupt governments that created crime
and gave unreasonable punishments to innocent people.
this what they warned you about, "absolute power coruptes absolutely"
. my father was an air traffic controler and i can imagine how
dishartened as a
kid I would have been. if they outlawed
another hobby like police radios. they did not invent digital freq
scanners until i was much older. my first radios were tube&transistor models.I
remember my family buying me a 4 band anolog radio
so I could listen to my dad in the airtraffic tower.what a thrill it was to
hear my dad.
the fcc will add another black market
because radio repair shops will not
fix anything illegal for fear of losing
their tech license.
.

and this would be a great hobby lost
for young&old. I am worryed
t
and collecter since a kid & remember
the scrooge job our govt has done since they first started regulating radio
it started with every small business going bankrupt that sold ham radio kits
and being a builder of radios

> US Navy transit navigation satellites...

Definitely not. Transit uses:

149.988 399.968 but I am not certain if any of these
are still active as that system is no longer maintained.

Almost certainly you are monitoring the two similar
Russian systems. Frequencies for these are:

149.91 399.76
149.94 399.84
149.97 399.92
150.03 400.09

The second Russian system wheich uses the same sort of signal
has all the birds on a single freq pair:

150.000 400.000

te bothe Russian and US systems tranmsit modulation
on the 150 MHz freqs but only a carrier on the 400 MHz freqs.
Check the corresponding 150 MHz freq when you hear the 400 MHz
freq to confirm the reception of these systems.

You can say that again (sucks up the juice). I used standard RS Nicads from my pro-62 in the 8200 after it went through the alkalines I had after 2 days. Those poor nicads were spent in only a few hours. I picked up some Hi-cap. ones to use instead which are 850mA. Any info on how much the Panasonics are and who sells them?

> I am interested in buying a scanner...

Well, you need to do a little homework FIRST before ANYONE can advise you on what to purchase!

What do you want to listen to...and what frequencies/bands are they on???

You just might need to purchase that frequency book...but I'll wager there's an Amateur Radio Club in your area, and there would be plenty of scanner info available from them.

I mean, I can recommend the Bearden XYZ-100 for $129.95 to you...but if it doesn't cover the bands YOU want, it's worthless for YOU in YOUR situation.

So...do a little homework. Join an Amateur Radio Club. Find out from others what is happening in your area. THEN look for scanners!

: The simple thing here is Don't get stopped by the police and they will never
: know you have a scanner.

Easier said than done. I've been stopped and detained twice and was given
no reason. I later found out that a domestic dispute hda been called in on
the road I was driving down and I was the only car and the address that
was reported didn't exist... so he stopped SOMEONE i guess to feel better
or what not.

The other time was similar, as I drove through town there was a break-in
attempt and again i was one of two cars stopped--- the only cars. small
towns suck that way...

It could be
a local rebroadcast of EMWIN (emergency managers weather information
network). Most local rebroadcasts are either 1200 or 2400 baud and
can be demodulated very simply. Try

http://www.weathernode.com

The weathernode software is used for managing the EMWIN data.

Oh well, I said it before and I'll say it again. The batteries to buy are the Duracell ULTRA type. These I am told are 1200mA and are set up for higher drain type devices. I also use them in my digital camera that is a real battery hog. I just suggest you find a wholesale source for them and buy them in bulk (chuck those nicads and nimh as they just don't have the "stuff"). Besides, I have been using my 8200 for a couple of hours a day for 6 days now and no sign of the batteries weakening. Check these out.

First of all, did you buy it from a European supplier as they will come in with the European Band Plan (different then over here). Secondly I don't agree with the complexity. I was able to get mine up and running a week ago within minutes as opposed to the 8000 I previously owned which I found very complex to operate. You just might have some actual problems with the processor. Obviously contact the vendor and have them either handle the programming or return for a new one.

that is right the 8200 uses a tight factor Murata filter and the performance is admirable. However the Sony 2010 has the significant advantage of "synchronous detection" and with this, the stability of a weak or crowded frequency is aided in a way even a filter cannot approximate.

Oh, no, no, no, Charlie! Please do not assume that I doubted you. It's just that up until now, I had assumed that this was all a simple trademark "flamewar." I did not realize that you were being literal when you told me Poor John Mackey was. . . . Well, I did not realize that his situation was truly clinical, rather than sociopathic. Perhaps we should be kind to the poor man and simply refer to his severe intellectual shortcomings as "Mackey's Special Problem." You know how he likes to be made to feel important, and I think the use of the word "Special" would give his poor ego a boost. And after all, he *can* be held up as a shining example of the accomplishments which someone of his intellectual capacity .. OOPS- of the accomplishments someone with a "Special Problem" can achieve given the right kind of encouragement. How many people with such a "Special Problem" know how to access usenet - or even use a computer? I think it's great that he has abilities other than "dumpster diving" for soda cans! He should be congratulated for his accomplishments.

When the digital camera boys get their NiCad's sucked dry they go
out and buy Ni-MH batteries. They feel that does the job for them.

Strangely I never see Nickel Metal-Hydride batteries discussed here.

Is that because digital cameras draw even more current that 8200's but
for a shorter time?

Before everyone rushes out to buy one of these, I just want to
say that I use to have one. After about one week of
being sick of distorted audio and an overloaded front end
I took it back to Radio Shack. To be honest I wouldn't give
$69.99 for that thing. If you're an amateure just getting
started in SWL its fine, but you'll out grow it very very
quickly
Thanks,
George

> for 6 days now and no sign of the batteries weakening. Check these out.

Adding to the previous comments, You can't have alkaline OR NIMH in the
AR8200 when the ac/dc adapters are connected. The adapter will, as the
manual states charge the Nicads when plugged in. I left the alkalines in
and the ac/dc adapter on for almost an hour before I remembered their
warning. Stay with NiCads. You can't error. The AR8200 didn't suffer any
damage as a result of my carelessness.

The Panasonic 1100mA NiCads and charger come as a kit at wholesale clubs
in your neighboorhood. Strangely the kit comes with four batteries, but
the separate battery packages contains six. So get the kit and two
six-packs for four sets. Panasonic sure did their marketing homework!

Hey here's my 2 cents on bad police officers. I got a ticket for cutting off traffic and illegally passing through an intersection for a total of eighty bucks. Problem was I didn't do any of these things. I don't know if the cop was having a bad day or what. I went to court and fought the ticket and the judge threw it out because the officer didn't put enough notes to document his charge. Anyway the moral of the story is don't trust ALL cops, most are good but some are bad, and always fight for what's right. Our system works most of the time. It did for OJ. Just kidding. Keith

Hi,
I have a Pro-91 and like it. However, I use it for a VERY limited purpose. We have a commercial trunking system here that the City Fire Dept. has moved to. I use it only to scan the Fire Dept. talkgroups on this trunking system. A very limited use indeed. It performs well for this, but a 10 channel trunktracker would work for me!
I did a little playing with it as a regular scanner and it works well there, too. For the money, I would snap up the 235XLT for a few bucks more. That is, if you need trunking. If you don't, check out Rich Wells' page of reviews and pick the conventional scanner you like best. You might save a few bucks, or for a few more bucks get a lot of added features. The site is: www.strongsignals.net
Myself, I just ordered an AR8200 and I am REALLY looking forward to it. I just hate waiting for it!

The location is difficult to describe so I
drew a picture in the Scanner Equipment column
in March 1996 Monitoring Times magazine.

If I recall, it also shows the location of the audio output
capacitor I've replaced in several BC800XLTs, too.

That should be a good start. I don't know much about scanning in SE
VA right now... I'm stuck out here in Blacksburg at college :)

One thing is for sure, though... you will NEVER be bored scanning in
Tidewater... you should be able to hear Chesapeake, Norfolk, Virginia
Beach, probably also Suffolk, Portsmouth, Hampton, and Newport News...
plus having the Navy and Norfolk Int'l Airport... there's always
something to listen to.

I would sure appreciate knowing what issue of QST you saw that in. I have searched the QST archives back to 1990 and can't find anything.

-c,

Send your Scout back to Optoelectronics and let them refurbish it.
I've found that the manufacturer knows best; and, if you're willing to
part with a few buck, they'll make it sing again. Plus, I've even gone
so far as to send a scanner back a SECOND time for a realignment
complaining the first wasn't good enough.

Hi, this si my first time posting but I read alot of posts on these groups
because I am interested in buying a scanner. First up, I saw a Radio Shack
scanner on special for 195.74 tax inc. (I live in Montreal canada) but I
saw in some posts and a couple of webpages that some scanners (handheld)
come with thingies to plug earphones with, so I asked the dude at Radio
Shack if they made some like that, the guy jsut stared at me and said no,
so I was wondering if there are some scanners that come with that.
2nd, I wanted to know what kind of scanner ~200bucks would buy me,
I'm interested in listening to the cops, EMS, fire dept. and other stuff
so does anyone have any ideas?

3rd. I would like to know if anyone have any freqs for the Montreal area
casuse I don't really feel like spending 24.99 +tx for a stupid book

thanks a ton

The problem with crystal oscilattors is that you cannot easily perform
frequency modulation, especially when they oscilate at higher overtones.

There is one IC from Motorola (UHF/VHF transmitter), that combines
PLL, prescaler, vco and XCO. This is probably simplest most efficient
way to go.

Message-ID: <ef7YT0dC#GA.360@nih2naaa.prod2.compuserve.com>
Source record: 139090

"Scott Lange" <langetec@nospam.com> asked:
> Where can I get the 895xlt connector to make the PC cable for computer
> control?

The interface is a 5-pin PCB header (.025" square pins on 0.1" centers).
The mating socket is standard (TechAmerica's Cat# 910-1471 is 25 cents), but
a segment cut out of a DIP socket will work just as well. The pinout is
symmetric, with pins 1&5 (the outer ones) carrying data in (to the radio),
2&4 are data out (from the radio), and pin 3 is ground.

The cable connections are:

BC895 DB9 DB25
1 <= to radio 3 2
2 from radio => 2 3
3 <= ground => 5 7
(TR-CD-DSR) 4-1-6 20-8-6 *
(RTS-CTS) 7-8 4-5 *

* If you will be using a standard communication program, add the two sets
of jumpers in the RS-232 connector to simulate the normal control signals.

The comm protcol is half-duplex, 9600 baud, 8/N/1. Commands to the radio
should be terminated with a C/R only.

Hmmm, was this your private residence or are you renting? Did your landlord give some OK to the LAFD to remove the ants? I have seen many amateurs rooftops look like a large rodent has nested up there. It sounds like your antennas may have been a hazard to the LAFD if they had to respond to a fire. If I lived in a building with something on the roof that would prevent the fire dept from saving my stuff, I would probably cut it down myself. It sounds like there is something your not telling us......M.

Owen you poodle boy. If you would get your head out of Unreal you would realize that a 2500XLT at $279 is a steal. The Pro 26 would require a risky $75 conversion which still won't give you full cell coverage. I can't believe a measely $4 is keeping you from happieness! Some times your Jewish blood just gets the better of you.

Hi, I'm interested in buying a scanner, and I have asked what kind I shold
buy, some guy told me to get a Uniden Sporter or something. but I don't
really want to spend alot of money and I wan't top buy it new, and don't
want to go all around town looking for one, so I went to Radio Shack and
looked there, I saw a PRO-29 the guy said he had one at home and its
great
(don't they always have the one at homeyou want to buy one?)
so if anyone has one or knows if its worth its let me know
I don't want to buy a uniden or something like that casue I don't know
here to get em in my area.
thanks

OK I don't know if this is a hoax or not, but if Uniden is NOT looking to develop a digital scanner at this time, I think I would sell any stock I had in the company. For a company like Uniden to not be looking to the future, of the market it's in, is cutting it own throat.

I CAN believe they do not have a digital trunk tracer now, but I find lt VARY hard to think they are not working on one. Just look at the effort they put into the development of the current trunk trackers.

They know what the trend is and they know they need to update their product line or go out of the business.

IMHO Gene...

The city of Lafayette Indiana is going to pass an ordinance
that will allow them to enforce all FCC regulations. It is patterned
after an ordinance from Wisconsin that has passed review by
the courts.

The danger is that this is what the Federal government wants.
If they can get the local governments enforcing federalize regulations
then they can write the rules but make the states and local governments
pay to enforce them.

The better way would be to encourage your congressman to
allow the FCC to keep all fines that are collected from violations
of FCC rules.

Lafayette's web page is: http://www.city.lafayette.in.us/

You can mail the mayor, Dave Heath at DHeath@city.lafayette.in.us

The ordinance will be discussed by the city council on Nov. 16th.

I've had my AR8000 for a year or two, and i just got an Optolinx today. I hooked it up to my Mac as per the instructions and ... nuthin. AR8000 Toolkit can't see the scanner.

I have the Optolinx set to Local Mode / Full Duplex. I have the AR8000 remote options set to 9600bps and delimter set to CR. I haven't eliminated any variables yet. the serial cable could be bad, the optolinx could be bad, the FFC could be bad, the AR8000 could be malfunctioning. man, i hate when new stuff doesn't work.

any tips?

thanks

Yeah, also consider that you can add the Optotrakker to a RS scanner with the
Opto interface and you're in business with a minimum of fuss.

Hopefully it will, I know I wouldn't buy one that just did EDACS,
right now there is really only one system I'd like to be able to hear.
We really need a good multi-system hand held you can go any where with
and tune to a control channel and be able to track a system.

Message-ID: <01be0992$bb3d8940$13ce2581@default>
Source record: 139146

Hi!
I have an AR1000XLT scanner for sale. It is in pretty good condition and has many features, such as:
500khz-1300mhz (absolutely no gaps, so yes that means cellular)
1000 channels
Selectable AM/FM/WFM Modes
10 Programmable Search Limits
Triple Conversion
VFO
Antennuator

and there are others. Along with the scanner comes the antenna, belt clip, and a manual, but no ac adaptor. I used my Uniden 235xlt adaptor and it charged it fine. I will sell the scanner for $155 (I just had it for sale for $175 a couple of nights ago) which includes shipping and I don't mind what kind of payment. E-mail me if you are interested. Thank you.

Good question Ed. Suppose I had wrote in about the same event happening..... let's see..this is from memory so grant me some latitude. I was in Corpus Christi last year and they were cracking down on school zones as someone had been struck at one earlier. So we'll call the place CC.

The other day I was on my way home from a dentist appointment, didn't even realize I was in a school zone, my attention had drifted to a group of cheerleaders and a time in my life when I might have honked and whistled as I drove by. Out of nowhere the blue lights appeared. Gads, I was doing 25 in a 15mph zone. I was busted. Oh, well. But the clincher was that they took my scanner and later never even acknowledged that I had one. I know you guys can't get my scanner back but at least it feels good to be able to get it off my chest. Thanks.

end of story

So Ed, the main difference between my story and Emilio's is the difference in dialect. Granted, there may be some true school speed zone zealots out there but I think those strongly affected by Emilio's story should reflect a bit on their own feelings about people who happen to be different from themselves. I would hope that the days of horsewhipping someone for being different are over. Aren't I the dreamer?

Blake,

I think he's already lost his original MCI account.

He probably signed up for another MCI/C&W account last night
when he realized that MCI/C&W had pulled the plug. If you'll
recall he did this 3 times with Sprint back in April.

This is a copy of an e-mail that I received from Sprint Security
back in April when John lost his account(s) for Rogue Cancelling.

O.K. this may be a dumb question, but...

When someone uses their cell phone, and are on a certain frequency, do they go back to that same frequency the NEXT time they use thir phone? If not, is there any method to determine what frequency they will be on?

OF COURSE I AM NOT SAYING THAT I LISTEN TO THIS STUFF!!! IT'S ILLEGAL YOU KNOW.

> continuous weather station on 162.475 MHz. I am unable to find out the kind
> of data that is being sent.

You are probably hearing SAME encoding. I believe it stands for
Specific Area Message Encoding. It's a way of notifying only areas where
severe weather is expected as opposed to anyone who picks up the signal.
So... if a tornado watch covers the northeast corner of County 1, all of
County 2 and the western half of County 3, only receivers (which understand
SAME and are properly set to know their area) will sound an alarm.

SAME can be used for non-weather related emergencies as well.

There's a specific way areas across the country are encoded, but I don't
recall how it works -- I think it's something like each county is broken
into 9 pieces and each piece has its own ID code.

SAME is used for non-weather emergencies and is integral to the EAS
(formerly EBS) system.

> Would anyone in this newsgroup be able to determine what type of data is being
> heard if I e-mailed them a .wav file of the sound? I feel that if I know what
> type of data it is, I could find some software that could decode it and put in
> in text form.

There are programs around for decoding the SAME messages but I couldn't
find them in a quick Altavista search. I think it's called WXSAME or
WRSAME.

Rat Shack sells the only consumer-grade SAME receiver that I know of.

Further info can be found by using Altavista (advanced) to search on

"weather" near "SAME"

I know what you're saying. I have a CoolPix 900 and I know I'm supposed to do a straight viewfinder shot to save the batteries, but I can't resist looking at the LCD.

Even modified the machine so it would stay on five minutes rather than 30 seconds.

In fact money budgeted for a Bearcat went for another flash memory, a USB flash memory reader for my desktop an four more NIMH batteries.

But this is the wrong NG for all that, and I'll likely get flamed.

On November 05 1998, you wrote:

Oh, I think it is "progress" all right. I can see where the trunk tracking features are kind of a pain, but have you checked out the OTHER features you can access from Pro Turbo ??? And yes, it HAS breathed a whole new life into the 232. You can now use the A/D ports for your own uses, or you can set them up for Pro Turbo to use. The scripting language and EPROM programming has been improved, as well, along with about 15 or 20 other enhancements! And IT RUNS IN WINDOWS. Maybe you should check the program out ! I already have my registered copy, and I am impressed. Terrific flexibility and versatility, both in the program and what it does for the interface. How about BUILT - IN recording to the hard disk, right from the sound card, and the ability to play back the resulting recordings SELECTIVELY ?
There is a lot more , too !

>Don`t know of any scanners that can be "modded" to do trunk tracking. Must
>have that function to begin with.....

This is untrue. You can add the Optoelectronics Optotrakker to quite a few scanners like the AORs, ICOMs, and RS scanners with Opto interfaces and do trunk tracking, as well as decode CTCSS and other functions. www.optoelectronics.com. Sells for $299, I believe (in which case you should consider getting a BC895 or something else, I suppose)

If you can also do it using two scanners like the AOR8000 and Trunker, a free program. I've looked into doing that way but it's more complicated than I can handle.

3621. Re: DX390 Shortwave/Clearance at Radio Shack $69.95 (orig$219.95)

Newsgroup: rec.radio.scanner
Date: 1998-11-06 00:00:00 UTC
From: "Chi K. Chan" <ckchan@interport.net>
Message-ID: <71vfst$15l$1@autumn.news.rcn.net>
Source record: 139166

I bought one of those rejects yesterday... returned it this morning.
On the radio I had, the battery compartment was screwed up, keep losing
power, due to a loose connection somewhere. And the SW band did not work,
but AM and FM worked great, but $69.97 is a little much for an AM/FM radio.
:-) So, I turned it in for a DX-394 (my second), also on clearance for $149.
Not the best radio, but with a few mods its a pretty good radio for the price.
And much better than the DX-390, I especially hate the long pause when tuning
between frequencies and the slow tuning nob.
The DX-394 is going quick also, if you want one, better hunt one down soon.
Also the Pro-2040 is going for $49.97 and the Pro-67 for $89.97.

Later...

I randomly listened and heard a sat on 149.91/399.76, with an rtty-like
modulation on 149.91.
But this is clearly not the same as the 400.1 signal for which I did not
yet find a corresponding signal above 150. But the 400.1 signal is a
bit weaker than the 399.76 and I may have missed it (being wider because
it is modulated, and having some computer QRM on/around 150 MHz).

What is the name of these systems? Maybe I can find the TLEs for these
sats and listen at the appropriate times.

I would bet that's exactly what you're hearing. For more info on
SAME, try the NOAA's info at
http://www.nws.noaa.gov/nwr/nwrsame.htm

>SAME can be used for non-weather related emergencies as well.

Correct. It's also used to encode EAS messages for broadcast.

Hope this helps...

It is good idea in my view NOT to take out parts. Since space is so
tight; I suggest a L shape took to be used and even on the remaining
of part of that L u should cover it with shield like so that it wont
touch the pins of the IC. I do not know how u can solder there in such
a tight spot without demagaing it or without pulling out the entire
IC. Also u need to drill a tiny hole some where, where u going insert
the jack. Also you will be need a "Shileded wire to run from Pin 9
to the jack (so L shape wire goes back to jack) and the other end
will be grounded.
Unfortunately I done that all; but my interface is not functioning
despite my efforts. Remember u still make or buy the interface too
because this modificatin is not enough in the pro-51. To build
interface U definely needs soldering tools.

good luck and let me know
bye

Radio Shack is currently closing them out at $49.97.
Seems to be an ok scanner, no cell, and can not be mod for cell.
At that price is a bargin!!!

Chi

3636. FS: The Best Scanner You Will Ever Own

Newsgroup: rec.radio.scanner
Date: 1998-11-06 00:00:00 UTC
From: malexder@aol.com
Message-ID: <19981106165402.17341.00000245@ng86.aol.com>
Source record: 139181

It's a long story, but I'm the proud--and broke--owner of two, very-expensive, high-class scanners and one of them unfortunately, has to go.

I have for sale an ICOM IC-R8500 along with the optional ICOM RS8000 software and cable. This wideband receiver is only a few hours out of the box. It is like-new in every sense of the word, down to the still-intact protective plastic covering on the display. It's the *continuous* version, and it has nearly every feature you could possibly imagine. In addition to its great specs and superlative ergonomics, it is a visually stunning brute. Truly, an extraordinary radio for the sophisticated scannist and shortwave listener.

Check out the ICOM America web site (www.icomamerica.com) if you need details about its specifications, a picture to look and other information. Also check out Grove/MT (www.grove.net) and some of the other web sites if you want reviews or user feedback (www.strongsignals.net/htm/radsrvyfdbk.htm)

I'm not looking to make a killing on the radio. All I want is to get back as much as I already have sunk into it, including shipping. Check around: The continuous models are selling for close to $2000 plus shipping (and this scanner weighs more than most newborn babies). I'm flexible to a degree and will respond to all reasonable offers. Again, this is literally a brand new unit and it includes optional software (surprisingly good software too, considering it is sold by ICOM) and cable.

3637. F.S. Pro43 and Pro34 Scanners

have one each of the above listed scanners. The pro 43 is in perfect working conditon with the modification done but in good shape. This one is not in mint shape, it's a little scratched up and the belt clip is gone. Works great though and asking 80+shp. The Pro 34 on the other hand is in great shape both working and as far as the looks go. Asking 80 as well+shp. thanks, Scott

The best bet is the Panasonic 1100 batteries at the cosco and sams club type stores. Cost is 14 dollars for a 5 hr charger and 4 batteries, and ten dollars for packs of 6 each batteries only. These batteries were longer lasting then the nmh 1200 batteries from rat shack. I returned my rs batteries at 12 dollars for 2 batteries and purchased the panasonics. Just one man's opinion. Keith

I am trying to monitor my counties MDT systems with a program that I have downloaded off the internet. The persons web page that I have downloaded it off of is local and I asked him to program in my counties MDT frequency, it worked for him.

My question is I have the BC895XLT scanner, I have the computer control cable and I was wandering if I still need to wire the discriminator to monitor this channel. What should I do?

Please let me know

>Before everyone rushes out to buy one of these, I just want to
>say that I use to have one. After about one week of
>being sick of distorted audio and an overloaded front end

I bought one of the first ones, but it was a display model. Not to worry, because it was as hot as a firecracker. The only problem was that the S-meter/battery meter did not work. So I took it back and exchanged it for a new one when they came in. Big mistake! The replacement was okay, but not nearly as good.

Radio Shack is famous for having that happen. Like as not, all the remaining DX390s are rejects and returns.

>port. Pro-Turbo and TRUNKER run at the same time under Win95/98
>(not NT) on a multi- tasked basis, with PT receiving and decoding
>commands from TRUNKER... PT then controls the PRO-2004/5/6. The
>2nd "any scanner" detects the trunked system data channel and feeds
>that data to the "data slicer".

>The second method using two PC's is much the same as above except
>that a null modem cable connects between a comport on each PC, and
>so each PC requires just two comports, each with a unique IRQ.
>Pro-Turbo and the PRO-2004/5/6 run under Win95/98/NT on one PC and
>TRUNKER runs under DOS (or Win95/98 DOS window) on the other PC.

So, either a Pentium PC with _three_ com ports, or two 486's with
a total of _four_ com ports, plus two scanners, plus a US$100
CE-232 interface...

This is progress? I think not.

Even though your particular scanner isn't listed on this website:
http://www.scancat.com/descrim.html

You can probably open your radio and locate correct chip
by matching up one of the NFM Chip numbers from the list with
a chip inside your radio.

> Because John realizes that MCI is about to boot him

No Blake, I still have my MCI/C&W service during this transition.
I am NOT under any threat of losing service as you are trying to state.

> from their service due to numerous complaints about
> his activities, and John does not want people to

I have done nothing wrong, so no provider would take such action.

Blake, your paranoia is making you delusional. In an effort make
yourself
feel better you have to make up stories about others. You appear to be
believing your own stories, just like you stories about the Fidonet
stuff.

You should go back to doing your thing as a two way radio installer
and stock room clerk.

WRONG again!!! I left Sprint to get 56K service & a local access number in Sioux City. Sprint never "pulled the plug" on me in any way.

> This is a copy of an e-mail that I received from Sprint Security
> back in April when John lost his account (s) for Rogue Cancelling.

your e-mail them was an obvious forge! Besides, I had a one week transition time where both accounts were active so your statement is proven wrong!!!

How pathetic you are!

The Standard AX400/400b ("Welz" WS1000/2000) are smaller overall, as is
the Icom R2 and the ham xceiver Q7A it is based upon.

Also the Yaseu VX-1R dual-band ham transceiver has wideband receive and is
used by some as an ersatz scanner; it is tiny as well.

3668. Re: Where to find frequencies for Chicago?

Newsgroup: rec.radio.scanner
Date: 1998-11-07 00:00:00 UTC
From: tandkmoran@aol.com
Message-ID: <19981107075801.01749.00000370@ng148.aol.com>
Source record: 138993

The Chicago Area Radio Monitoring Association's newsletter has been converted to an e-mail list!

All list functions, help files, etc can be accessed through our host's web site:

http://www.qth.net

To subscribe manually send an e-mail message to:

majordomo@qth.net

In the body of the message type one of the below:

subscribe carma

-or-

subscribe carma-digest

(Whichever you prefer; the "subscribe carma-digest" command results in you receiving a compilation of messages, when ever the buffer is full - about 40k. The regular subscribe command results in you getting the individual messages as they are sent)

You will receive an authorization code and further instructions. Essentially, you just send the coded command back to majordomo@qth.net

Postings to the list go to:

carma@qth.net

You must send the subscribe commands, (all commands, in fact) from the same address you will use to receive the messages. Remember, commands go to majordomo@qth.net, postings go to carma@qth.net

You must be a subscriber to post to the list.

If you are a scanner buff in the chicago area you'll probably want to be a subscriber.

And don't forget our web page:

http://www.theramp.net/shabec/carma.htm

Or the BBS:

(630) 852-1292 8/n/1 ($15/yr for full membership)

Snail mail still goes to the PO Box, but we are no longer accepting new subscriptions to the printed version of the newsletter (or renewals). If ya got paper, send it to:

CARMA

PO BOX 2681

GLENVIEW IL 60025

Happy Scanning!

Ted Moran

CARMA List Admin

>BC235XLT = decent mobile trunking
>PRO37 + laptop + PRO2006-W/OS456 = excellent mobile trunking

Sorry, but aren't you limited to monitoring one trunk at a time
with your setup? The laptop can't tune the 37, can it?
If not, that isn't excellence in my book. The setup sounds
a bit clunky - 2006's aren't exactly small scanners, and they
need that 12V power cord.

I'll stick with a Pro-43 and a small laptop; It's cheap,
completely self-powered, highly portable, and tracks multiple
systems along with conventional channels.

SENSITIVITY: Scanner # 1

.....WFM: 30 dB S/N at 22.5 kHz deviation

.....25 MHz - 520 MHz 3 uV
.....760 MHz - 1100 MHz - 1300 MHz 3 uV

AM:20 dB S/N at 60% modulation
.....25 MHz - 520 MHz 2 uV
.....1100 MHz - 1300 MHz 5 uV

Which is more sensitive particular in the vhf lo range? the first one or the last one?
It seems that sensitivity is by mode (i.e. nfm, wfm, am) but does a higher number mean more or less? And whats the difference between uV and micro. The two scanner specs listed are for the RS pro 2006 and pro 26 models. I'm just trying to understand the dB (decibel?) uV (?) and micro(?) terms and how they apply to the sensitivity.

Scanner # 2
Sensitivity (20 dB S/N with 60% modulation for AM; 3 kHz deviation for NFM;
30 dB S/N with 22.5 kHz deviation for WFM)

NFM 40.84 MHz.....0.5 (Micro)
S+N/N=20dB 162.4 MHz.....0.6 (Micro)
453.25 MHz.....0.6 (Micro)
954.9125 MHz.....0.8 (Micro)
1299.9125 MHz.....1.0 (Micro)
WFM 62.45 MHz.....5.0 (Micro)
S+N/N=30dB 195.5 MHz.....5.0 (Micro)
531.5 MHz.....5.0 (Micro)
765.25 MHz.....5.0 (Micro)
AM 25.5 MHz.....1.3 (Micro)
S+N/N=20dB 108.5 MHz.....1.5 (Micro)
127.175 MHz.....1.5 (Micro)
230.05 MHz.....1.5 (Micro)
325.05 MHz.....2.0 (Micro)

This story has taken on its own life and in some iterations, resembles an Urban Legend. I welcome you to read (my) earlier posts in the http://www.dejanews.com archive.

I also encourage those who have a pressing "need to know", to contact *BOTH* the apparent plaintiff (Khalil) and the apparent defendants (his Homeowner's Association and Property Management Company) to hear their sides of the story.

The LAFD has nothing otherwise to publicly to state on this newsgroup regarding a civil matter between the above mentioned parties.

I'm sorry that I cannot entertain e-mail on this matter. Thanks!

Yes, This scanner can be modified to receive cell phones in 800&900mhz.

> * I take it that the preprogramed frequencies for Pennsylvania are
> not complete. Where could I get a listing of other police freqencies
> to program into this?

Your right. They are not complete. You can pickup a copy of Police Call
at Radio Shack for $12.00. It is the most complete listing I have ever
worked with.

> * What do you think of this model? I got it primarily to help avoid
> speeding tickets, but I do enjoy tinkering around with it.

That was a mistake. The alert only goes off when the highway patrol car
has its repeater turned on. This is mainly used for when the officer
is out of his car. I like the scanner a lot. It works well in my truck
and home.

Well, good for you John. I certainly hope that it works out for you.

And John, why did you post this to the other newsgroup? They
don't care, and it has nothing to do with this.

>Blake, your paranoia is making you delusional. In an effort make
>yourself
>feel better you have to make up stories about others. You appear to be
>believing your own stories, just like you stories about the Fidonet
>stuff.

John, just a little bit vicious here, aren't you? I have made up no
stories about FIDO.

>You should go back to doing your thing as a two way radio installer
>and stock room clerk.

Actually John, the position I offered you as installer at my shop is
still open, salary to be negotiated. 12 days holiday, 2 weeks
vacation, uniforms, GREAT HMO, and a bonus plan that
can't be beat. We are opening a second shop, and we will
need someone there.

Now, understand, you have to climb towers in this position, as
I explained.

I also need proof of your disability so that I can deal with Chuck
and get the tax credits for hiring someone in your situation.

We are not large enough yet to have a position as stock room
clerk, but as we grow, we might be able to promote you into
that.

And lastly, no, I will not allow you to hang up that paper that
says Master of Communications Technology, as we all know
now what that really represents. Something of a scam I think
is fair to say. You can however, continue to display it
proudly in your own living room.

3682. John's Degree

Newsgroup: rec.radio.scanner
Date: 1998-11-07 00:00:00 UTC
From: bbowers@townsqr.com

Source record: 139007
Cross-posted to: rec.radio.scanner,alt.radio.scanner

John's claimed "degree". He stated it is a "Master of Communications Technology".

Would anyone else like to have one? It only takes a little bit of studying, about a week if you read slow, a 30 minute or so test, and $30-45 dollars.

That's it. Mail order!

All you have to do, is take a GROL test, the FCC license test, from any NRE examiner. NRE examiners give testing on HAM tests, and FCC tests. Often times, in your own community!

You then get back in the mail, an official looking parchment, proclaiming that you have achieved an

MASTERS OF COMMUNICATION TECHNOLOGY, issued by NRE.

It is of course worthless, a crock, and thrown out by many. The purpose of the test is to get your FCC license, which has been dummied down over the past 15 years to the point where it is a complete and total joke. NRE provides this certificate as a feel good item, as of course they are not a degree offering school like a college or university.

And to compliment John, I don't believe this is one of his famous lies, I can find no spot where he states he attended 4 or more years at a college to obtain this degree.

He did however, omit some very pertinant information.

Why don't you use your head a little and see who the offender really was in your situation.
1) You addmitted you were speeding in a school zone
2) You were in possession of an illegal device (in some states)
3) You tried to lie to the police.
Hate to inform you of this, but the police have a job to do, and its people like you that are their best customers.

Just an opinion of a future Law Enforcement officer....

Secret reasons for Gingrich resignation.

Friday, November 6, 1998, 9 PM EST

The announcement only hours ago, by Newt Gingrich
that he will step down as Speaker and that he may not
continue his term as Congressman for Georgia's 6th district
follows the delivery at his office of a certified-mail
package of evidence submitted pursuant to the Inquiry
of Impeachment and notification Friday afternoon from the
Office of Independent Counsel in Washington that my
message to the OIC is being forwarded to IC Starr's office.

Gingrich is my Congressman and I have requested him to investigate
certain issues pursuant to this case and asked that he work with
the Judiciary Committee to bring a witness before the Committee.
This he cannot do. Gingrich takes his orders from the same source
that President Clinton takes his orders: The Council on
Foreign Relations. If Gingrich had followed my request, it
would have resulted in an expedited resignation from the
President facing certain impeachment by the Senate on
better evidence than that so far submitted by IC Kenneth
Starr.

Speaker Gingrich has chosen to take this exit rather than
get involved in an investigation of a fellow member of the
Council on Foreign Relations.

You may review certain parts of the evidence, those which
are not classified, at the website below.

Hi all,

I need to replace the batteries on my 2810. Does anyone have any info on this.
I called Opto and they want $29.00 just for the batteries. There NUTS!
Has anyone out there replaced there's?
What's is involved?

Thanks,
John N2GYN

PS: Please e-mail me direct if you have any info.

3701. Yupi MVT9000 vs Uniden 235LXT?

Newsgroup: rec.radio.scanner
Date: 1998-11-07 00:00:00 UTC
From: Ted Birckhead <birck@ibm.net>
Message-ID: <3644AE58.6C65A217@ibm.net>
Source record: 139026
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I am presently using a 235LXT and am considering an MVT9000. I find
the basic capabilities of the 235 fairly adequate except for the lack of

search banks.

I probably would not use many of the other extra capabilities of the
9000,
but wonder if the 9000 would have:

1. Better sensitivity (especially in the 800mhz area).

2. Less intermod and resistance to overload when using an outside
antenna.

3. Other benefits relative to reception quality that would justify a
switch.

I would appreciate comments from any one who has had the good fortune
to have used both.

Thanks-
Ted--

The "packet-port" is the diskriminator-output. It works ONLY on FM. You
can use it for some other digital-modes also.

regards
odo

If having more search banks is a requirement, there are certainly several alternatives to buying another radio that will cost you 2.5 times as much.

>I probably would not use many of the other extra capabilities of the
>9000,

If you know this in advance, then you may have already made up your mind, it seems.

>1. Better sensitivity (especially in the 800mhz area).
>

The Yupi has better sensitivity overall. But if you want trunk tracking features specially, you won't get them with a Yupi, which has none. If you are implying that you want to receive cell phones, the 235 obviously won't and the Yupi will.

>2. Less intermod and resistance to overload when using an outside
>antenna.

That depends where you leave, more than anything else. The Yupi (at least the unmodded version) will probably get buried if you live in a heavily urbanized area. I live in an ex-urban area and the Yupi is perfect for it.

>3. Other benefits relative to reception quality that would justify a
>switch.

It's a better scanner, in every way, but it won't trunk track. It's not a difficult scanner to master but it's not something that I would recommend to a beginner (only you know what you are capable of mastering, obviously).

>I would appreciate comments from any one who has had the good fortune
>to have used both.

The Yupi is the best handheld I have owned, but I think you are comparing ducks and butter, or Cheek and Mackey, or doo-doo and voodoo, since these are considerably different scanners.

Here's some reviews that will help answer some of your questions between the two:

http://www.strongsignals.net/htm/imp90.htm

http://www.strongsignals.net/htm/imp91.htm

I just bought a PRO-91 a few days ago and have been thrilled with it. Does a great job handling our trunked public service systems. It's fairly compact and has a good feel to it. If you can live with 150 channels and buying the extra charger and AA nicads for around $18 total, then it's a very good scanner at the current $169 sale price.

Here you can get a CW software that really works !!!

The Morse Decoder MRP37 is a "Just easy to use" Software using your PC +

Sound card. Clear text is decoded and displayed on the screen.
Even under very weak audio conditions MRP37 performs excellent results!
Comfortable Morse sending functions included.

See more information's and get a free demo version at:
http://members.tripod.com/~PEeng/morse

Really good stuff!

Agreed, I have an R-7000 and haven't turned it on for five years. I would rather step on it and throw it in the trash instead of selling it for that price. I will use it once I get my antenna's outside again.

Hey..another person with the spelling of their name like mine!!!
I'd go with the new Sony SC1. It has 25-1300Mhz no gaps(except cell), 300 channels, great recieve, and excellend serach features like TV and FM radio plus lots more like Police, Fire, Marine and more. i bought mine for $260 from Scanners Unlimited. They have a site on the net. Trust me, if you buy a Sportcat, you'll soon want to upgrade it. In fact, I had a Sportcat(I still do) but when I got my Sony, the Sportcat has sidelined and very very rarely do I use it. Don't get me wrong, the Sportcat is a good scanner, but you can get a better one and you probally will one day so why not get it now.

> I think the source is Orbcomm!

>Sven

I have followed this lead, and it seems to be right.
Orbcomm apparently has licenced the range 400.05 - 400.15 and
the reception of the carrier on 400.1 coincides perfectly with the
passes of Orbcomm satellites.

I have received noise that sounded like data in the 137-138 MHz segment
at the same time.

It remains interesting to know why they send an unmodulated carrier
(I don't hear any modulation or sidebands) on 400.1
Maybe it is modulated when the spacecraft are within groundstation
range?

Anyway, the signal is clearly not related to navigational satellites
that were mentioned (and that I also have received, at least some of
them)

The Radio shack catalog has not been free for three or four years now. How ever there is one three dollars (or was I haven't picked up this years issue yet) that you could use on a purchase. SOme managers let me buy the catalog with it. I've been watching this for a few weeks with out saying anything. I guess I don't understand why this is news? Or why people are upset about something that has been going on for a couple of years.

other stuff SNIPPED

Gee Blake, this latest story of yours is very entertaining
& shows a great and active imagination on your part! Congrats!

> from any NRE examiner. NRE examiners give testing on
> HAM tests, and FCC tests.

That's funny, I looked on my list of FCC recognized VE Coordinators
& see NO WHERE is NRE listed.
Plus according to the FCC web site, there is NO group called "NRE"
authorized to give "HAM" (or amateur radio) tests or licenses.

The only conclusion is that your data is SERIOUSLY FLAWED or else
TOTALLY INCORRECT!

I might add in my nearly 10 years of being one of the most active
VE's in the US, I have NEVER heard of ANYONE getting a "HAM"
(or amateur radio) test from a group called "NRE". Of course,
you would know nothing about that as you have only been a ham for a
few years & your license is to low to qualify for Volunteer
Examineer or Official Observer status!

In your desperation to put down others (me this time) to make yourself
look better you have used information that is obviously fabrication
& lies, not to mention just plain incorrect!

> MASTERS OF COMMUNICATION TECHNOLOGY, issued
> by NRE.
>
> It is of course worthless, a crock, and thrown out by many. The

You are stating I have this, so how do your support your statement?
What verifiable proof do you have? You have asked me MANY times for
information of my degrees, which I have told you I would NOT give to
YOU because of your history of manipulation but that I would give
to a impartial party. You then refused this plan.

Blake, the truth is that you have NOTHING to support your statement.
You only made this up about NRE & all to support your desire to make
your self look good by making others look bad. If you REALLY had proof
that I had this NRE certificate you would have a date & certificate
number
or SOMETHING to track what was issued. Instead, you have NOTHING!!!!

> He did however, omit some very pertinant information.

You are the one to omit the pertinant information, Blake! You gave
NOTHING to support your statement.

3747. DOS PCR-1000 control program - Updated!

Newsgroup: rec.radio.scanner
Date: 1998-11-07 00:00:00 UTC
From: "Ray M. Ransom" <*micosyen*@bigbear.net>
Message-ID: <722fg1kfp1@supernews.com>
Source record: 139072
Cross-posted to: rec.radio.scanner,alt.radio.scanner

DOS Control Program for Icom PCR-1000. You don't need an expensive Windoze computer to control your PCR-1000 to do all sorts of scanning and searching. Any old laptop and most palmtops will do, and with many more features than the Windoze program that comes with the radio. This program will also run VERY fast in a DOS box under Windoze 95/98.
==========
New version available.

No bugs have been fixed, as nobody out there has reported any.

The following new features have been added:

- Search mode
- Search mode with log to disk and auto lockout
- Programmable scan/search speed
- Programmable consecutive inactive scan count to release temporary lockout
- Improved manual frequency entry
- Command line help

That's about it. I'm getting bored with this and don't know what else to add anyway. It might have finally grown to over 10K bytes, but it's still free. Please use the e-mail link at the site below for comments, questions or bug reports.

If it is conspiracy, then why does FCC Chairman Kennard risk his job to cover it up? Why does FCC and FBI classify documents? Why does it take an investigation by the House Judiciary Committee to get Department of Defense to admit involvement in the jamming also? Why does the White House fail to deny that Clinton signed orders to suspend the Communications Act?

Liberals don't want to answer such questions, they just say, "take it to Art Bell." Sure is easier than actual human thought.

The evidence at the website isn't impeachable, Clinton is.

> Who are you trying to fool here with this "Today I noticed a new Calling All
> Citizens web page banner," crap? It's YOUR web site! "Today I noticed"

Hmmm, I think you should see the newly "discovered" CAC banner first. Indeed it uses the two formerly composed banners we are all familiar with. However, THIS banner was ingeniously done by a webmaster whom I've yet to have any contact with, is *animated*, and includes two panes in said animation that are apparently original works by the artist. Maybe you've seen this before since it looks like it's been up two months or so, but *I* only stumbled across it this month. *When* I found it, aside from encouraging newsgroup readers to go look at it, I posted it at my site as well. I mean, that IS easy to do you know.

Sorry for any misunderstanding.

3755. RS PRO-91 Comments

Newsgroup: rec.radio.scanner
Date: 1998-11-07 00:00:00 UTC
From: Alex Pazaratz <alexp@netcom.ca>
Message-ID: <01be0aad$517080a0$09dd92d1@alexp.netcom.ca>
Source record: 139107

I'm happy with my PRO-90 but I'm considering buying a PRO-91 while it's on sale.
Can anyone tell me how they compare? I know the PRO-91 has fewer channels. My main questions are: #1 Battery life - I have always preferred scanners which use rechargeable AA batteries, as opposed to the specialized battery packs (like the PRO-90). How much battery life does the PRO-91 provide in trunking mode? #2 Sensitivity - I like my PRO-90 but I find several of my older RS handheld scanners (especially my PRO-51) are much better at pulling in signals. #3 Search options - any RS handheld I have seen allows you to start with any frequency and then search up or down from that frequency, without punching in "search range limits". Can the PRO-91 do this?
#4 Antenna - I'm not very impressed with the PRO-90 antenna. Is the PRO-91 any better? I'd check all these questions out myself but I'm in Hamilton, Ontario and RS doesn't sell the PRO-91 in Canada yet. I can pick up a PRO-91 in New York State, but I'd appreciate it if someone could tell me if it's worth the trip. Thanks. Alex.

>fuss.

Well there you go. Sounds simple enough!

BTW, the parts list should've been:

Either a Pentium PC with _three_ com ports, or two 486's with
a total of _four_ com ports, plus two scanners (one being a valuable
200x), plus a US$100 CE-232 interface, plus Pro-Turbo for CDN$50.

No offense to anyone who decides to go this route, but I just
have to laugh when I think of someone trying to go mobile with
this setup; A desktop system with monitor (since I haven't seen
any Pentium laptops with three RS-232 connectors on the back),
plus two scanners (including a bulky 200x).

OK, if you have two laptops, each with two serial ports on
the back, then you can leave the desktop in the den.
Still seems like a mess of boxes and cables.

I'll stick with one of my 43's and whatever laptop is within reach.
One scanner + one laptop + one cable = decent mobile trunking.

>Monitoring Times on the other hand, is a disgrace. The magazine is
>little more than a shill for Grove Enterprises. I used to subscribe
>but I was put off by the editorial bias, the poor production

Couldn't agree with you more. My favourite was Bob's review of a
Grove-designed product (an ill-fated receiver IIRC, but my memory
may be a bit fuzzy on that). His response to the inevitable
outcry - "Who better to review a product than the person who
knows the most about it". Makes sense to me! :)

>Now, I'll put my helmet on and hunker down for the usual flames on
>this subject.

You don't need much when you're standing on the high ground.

> "NOT a bona fide amateur radio operator holding a technician class, general, advanced, or extra class amateur
> license issued by the Federal Communications Commission but holding a Technician Plus class license"

Not quite correct. This law was created before the Tech Plus license change came about. Yes, the law needs revision but it is _obvious_ that its intent was to exclude all amateurs from the restriction. You may feel safe under this law even though it does not specifically mention your class, you are meant to be included.

An amateur in Lubbock, TX put up a toweer that conflicted with the local codes. His installation was red-tagged and an order was issued for him to remove it. He argued his case (through ARRL lawyers) that he fell under federal rules which superceeded local law and won. The rules state that no one shall damage an amateur station.

Actually a small scanner retailer/ friend in my area has found many problems with the very limited number of units he recieved. So deaf were the radios he simply sent ALL of them back to AOR. I really am dying to get one myself if they ever get them up to specs and get rid of the problems with picking up their own cpu noise. He sent them back about 3 weeks ago so (all unblocked models..I am pretty sure US govt flavor, not UK)...today is Nov. 7, 1998.

I'm trying to program a scan edge frequency.
I press and hold the prog key, SET appears briefly, followed by a blinking PROG. Then use the M-CH
selector to select 0p1, then enter my frequency, say
42.000000, hit MW. And for some reason the frequency resorts back to the previous setting, 145.00000? I'm I doing something wrong?

Help
Mark

Better yet, simply add the poster's name to your kill file. Then you'll never see another E-Bay post (or any other type) from that person again. If enough people use this method of "banishment" it will eventually stop the posting of E-Bay adds on the newsgroups (providing the E-Bay posters have any interest in posting other types of messages on the newsgroup).

I'm trying to understand the instructions included w/the BC235XLT for programming / selecting banks and then the individual scan lists. I seem to be continually 'writing over' just entered freqs. Are the banks selected BEFORE going into trunking mode? How do you tell which bank you're in? The same for which scan list your monitoring? I've been scanning for 30+ years and have never come across such a poorly written instruction manual - do others agree or is it just my lack of comprehension? PLEASE e-mail responses-Thank you!

Source record: 138883

In my experience, you won't find many who will part with a PRO-2042. It's a darn good scanner and RS doesn't sell them anymore. I bought mine at RS a year and a half ago, I paid $399 for mine, and I would not sell it unless I was deperate for cash (unlikely). One thing I'd like to have on the PRO-2043 is what I have on my Drake R8B shortwave receiver - an alphanumeric display for a channel.

>Would I gain any sensitivity or reception with the mobile over the handheld?

The volume from the 235 is too low for comfortable use in a vehicle. An external speaker is not much help. You'll probably need an amplified speaker (~$25 from RS). The 2066 is plenty loud enough with just the built in speaker and very good with an external speaker.

The 235 display is not lighted except for a few seconds when you push the light button. The 2066 display is always lighted.

Most of the buttons on the 2066 are easier to push in a car than those on the 235.

The 2066 has CB scan. OK... Maybe that's not an advantage!

The channel indicators and bank indicators are separate in the 2066 not so in the 235. In addition when tuned to the voice channel, the channel number is indicated by the 2066. In search mode it also displays the control channel number.

The 2066 has an alternate squelch method available in trunking mode. This fixes the problem exhibited by the 235 on some systems, where distortion in the sub-audible range causes the voice signal to chop out.

With regard to sensitivity and intermod performance; I haven't made any measurements, but they both seem to be about the same with perhaps a slight advantage going to the 2066 with respect to intermod.

And finally, the 2066 just looks better in the car.

Hi

My Sandpiper antenna fpr 144/430mc, that was scotched on my cars backwindow
has fallen down and was damaged
now I am looking for a store to get a new one.
here in HB9 there are no more dealers selling such products

can anybody help me please

Anything is possible, but your idea really isn't a good idea. You could pound a nail into a piece of wood for an antenna, but that isn't a good idea either.

Go to radio shack & buy one of their scanner antennas, that is the easy plan with reasonable price & performance.

Your best bet is to order from Ham Radio Outlet in Salem, NH or one of the other mailorder houses. You will get much better prices and overnight delivery from HRO.

Kinda like using a riding lawnmower to get to work. It would get you
there, but would perform pretty lousy for what you want.

>Also, if it IS possible, is there a way to build the antenna? I realize
>that you'd need an antenna, cables, BNC plugs, and a dish, etc.

You could build a dish .... you could build a lawnmower... probably
wouldn't be worth the time, though.

You can, however, probably build a fairly effective antenna for a scanner.
It wouldn't be a dish, though. You really either ought to just purchase a
nice made-for-scanners antenna from Radio Shack, etc., or go to the library,
check out the ARRL Handbook for Radio Amateurs, study it, and then build your
antenna.

You must be in trunk mode before entering any frequencies in a trunk group.
Also
if you know what the control frequencies are enter them first so the scanner
finds
them quicker when you begin scanning a trunked system.

<snip>

It may be helpful to think of the trunking "side" of the scanner as
totally unrelated to the regular side. It isn't, of course, but if
you start off thinking of it in that way, you'll have a lot fewer
barriers to getting started in trunked scanning.

Well..... I was going to start recommending some equipment and procedures for you, BUT since Shelly D. did such a nice job of exposing your true character (thanks Shelly!), I changed my mind. But, you can find what you are looking for in many books out on the market. Also on some internet sites. Search under TSCM. Search under countermeasures.... search under the carpet if you don't find it (a little Groucho Marx humor for ya).
My 2 cents worth also.
Peace.
Joe

No, on the plan I have the "direct connect"(2 way statewide radio) is
unlimited for $50 per month.
Remove the '1' from my e-mail address when sending e-mail

3835. What Bugged Room???

Newsgroup: rec.radio.scanner
Date: 1998-11-08 00:00:00 UTC
From: THEANTIASSHOLE@webtv.net
Message-ID: <21348-36469D4F-104@newsd-121.bryant.webtv.net>
Source record: 138925

There are ways to bug a room that do not require in any way for the people doing the bugging to have to enter the room to "Plant" a listening device of any type in any way. These methods involve microwave beams that are aimed at a room or dwelling from distances that can be up to one mile away. The device transmittes a virgin or non modulated microwave beam that penetrates the walls to enter the room, the beam bounces around within the room and becomes modulated as the sounds within are "Imposed" on the virgin beam, the beam then bounces back, much weaker than when it was transmitted, but with enough carrier and modulation to be received by a very high gain low noise receiver that allows the sounds from the room to be heard. A variation of this tecnology can provide video through solid objects likes walls, or the roofs of houses. Again without having to plant any type of camara or device. If you are being surveiled by any devices of this type, you are not going to find them because they operate on frequencies that are so high, sometimes up to 325ghz, that unless you have a ninety thousand dollar spectrem analizer, you have no chance of finding this. The chances that this type of device is being used on you are slim to none. They are only used by the Cia, FBI, NSA etc... Do not listen to anyone that says that these types of devices do not exist, they are either supremely ignorant, or they are purposely lying so that the public at large will not know that their rights are violated in extreme ways every day by technology like I have described here. There are other techniques as well, but thats a whole other story.

There may be a question as to the real reason John is leaving, but...

Just in case you haven't tried it yet, try the MaxMTU update for your Windows Registry. This was described in a recent Magazine (PC Week ?). However, the description there was incomplete. The book "Windows 95 Secrets" explains how to make this update in detail.

I can't give you quantifiable numbers, but this made a tremendous increase in I/O speed to my PC. Supposedly it modifies the Buffer efficiency in Windows for TCP/IP comms..

A while back I upgraded my modem from a 14.4k to a 56k, but I definitly did not get the speed increase I expected. After making the change, it seemed like I got the speed increase I should have gotten from the new modem.

All of my friends who have tried it have faster downloads now. Some do get more increase than others.

Good luck, I hope it works for you too.

Howard Higgins

>.....25 MHz - 520 MHz 2 uV
>.....1100 MHz - 1300 MHz 5 uV

>Which is more sensitive particular in the vhf lo range? the first one or the
>last one?

What exactly are you asking ?
There are 3 sets of specs here...Sensitivity for Wideband FM,
Narrowband FM and AM.
Mode affects sensitivity in that it is a measurement of signal to
noise ratio, often referred to as SINAD.
Sensitivity most certainly changes with mode, mostly due to
the bandwidth of the signal. An AM signal carries more noise
than a narrowband FM signal of comparable strength.

One thing to watch in comparing specs however is that manufacturers
don't always compare apples to apples...that is, some use different
means of expressing their specs so you have to be careful.
Some manuf's list narrowband FM sensitivity at 12dB SINAD
while others do it at 20dB. The 20dB spec is going to look a lot
worse than the 12dB spec. The lower the value, the more sensitive...
ie... 0.2uV for 12dB SINAD is more sensitive than 0.3uV for 12dB
SINAD. You can't really compare FM specs to AM specs...
they are 2 different measurements.

Another lie from colostomy for brains mackey.
CW.net does have a local phone number for Sioux city,
Sioux City IA (712) 252-6300
Check this site http://www.cwix.com/cgi-bin/LocalAccess/localAccessNum

Further proof mackey's a lying sack of dung .

That is all he does is lie and cause trouble on the newsgroup.
He gave his word when Bill was no longer on here he would stop his crap but as
can be seen his word is just as worthless as he is.

Philip,

You can start with one of several free shareware type programs that use your soundblaster card. Examples of these are WDECODE, BTL (Blaster Teletype), FTV etc. These do not require any special interface - a microphone connected to your PC is sufficient. You get some improvement if you connect the radio to the line-in of your PC.

One step up from this is to use a simple comparator interface - often called a Hamcomm type interface. If you are reasonably handy with a soldering iron you can make one for under $10 - with parts from Radio Shack. You can also buy one of these for anywhere from $30 - 70. These connect to your serial port and you need software like RadioRaft or Hamcomm. There are a couple of others out there. Anyway both of these are avaialble for about $30 (registration fee) and are capable of decoding many different modes. I am at this level and have spent many enjoyable hours learning to use this software. Don't expect this to lock in and automatically decode everything. Its a little harder than that. If you decide to try this, let me know and I will be glad to provide as much guidance and direction as I can.

Then, a step up from this is something like the Hoka Code3,or the KAM+. I'll let someone with some experience with these give you a feel for them.

Hope this helps....

Hi Bill,

you are right and I agree with you!
Please let me inform that MRP37 provides much more than usual demos do.

The user can verify the performance of the Morse Decoder (Demo) using
REAL CW AUDIO SIGNAL from your receiver!
Just tune a real CW station make a record using record function of MRP37
Then execute playback function and explore ALL full version features MRP37
provides!
Don't hesitate to test MRP37 with weak cw audio signals, MRP37 will manage it!
There is one big advantage using the Play-Back-Mode:
The user can check the recorded signal multiple times; selecting different
frequencies and adjustments of MRP37.
So this way is evaluation and learning how to operate at the same time!

Go this steps:

-Execute C:\MRP373\Rec.bat
-Record up to 12 minutes real CW-audio from your receiver.
-Then exit Morse Decoder by typing Esc Esc
-Then Execute C:\MRP373\Play.bat and operate like advised in readme.txt
-Watch the text window and see Decoder results in time.

But that is not a scanner "mod", it is adding on a whole new device. It hardly falls into the category of a modification.. He sees the difference. Why don`t you ? I wouldn`t call the CE-232 a "mod" either. A "mod" is something you can do with just a few parts in hand, or clip a diode, or move one. etc. No, the Optotrakker is not a "mod". That statement is just plain silly.

I figured he must be a "mail order cowboy". He was the one that was claiming
Bill`s licenses were "fake". Guess the worm has squirmed on that one.
Seems that he was just telling us about himself. While he is mail -
ordering licenses, he should have mail - ordered himself a brain and a life.
His staple diet is Cracker Jacks. You know how many boxes you need to eat
before you get this stuff. When he passes gas, it is so dry that it HURTS,
and that is what makes him so mean. Each peanut thrills him to the marrow.
Good thing though, with that rear end. Without it, he would be a loose as a
ruptured duck........

I have always in the past run TRUNKER in DOS, using Com Port 1. I would have to unplug my mouse to do this though. I've managed to run trunked in windows, but it will only work under Com1, I can not get it to work any other way. Can anyone give some insight on getting it to work with Com2, or setting it up. Basically I want to be able to run TRUNKER under Windows AND be able to use my mouse. Thanks in advance!

I have always in the past run TRUNKER in DOS, using Com Port 1. I would have to unplug my mouse to do this though. I've managed to run trunked in windows, but it will only work under Com1, I can not get it to work any other way. Can anyone give some insight on getting it to work with Com2, or setting it up. Basically I want to be able to run TRUNKER under Windows AND be able to use my mouse. Thanks in advance!

Jeff

3881. What Bugged Room ????

Newsgroup: rec.radio.scanner
Date: 1998-11-08 00:00:00 UTC
From: chainsaw@softhome.net
Message-ID: <3645ca1a.3975087@news.auracom.com>
Source record: 138971
Cross-posted to: alt.private.investigator,alt.security,rec.radio.scanner

I was wondering what are some methods and/or equipment(affordable?)
that could be utilized if a person believes a room is "bugged" ?
Would cheaper equipment like freq.counters and/or hand held scanners
be of any use for "sniffing"?
Any opinions and comments you may have would be great!

3886. Using a sat. dish as an antenna

Newsgroup: rec.radio.scanner
Date: 1998-11-08 00:00:00 UTC
From: James Tierney <grizzly@mediaone.net>
Message-ID: <3645E154.4F3C5D14@mediaone.net>
Source record: 138976

Is it feasable to use a sattelite dish as an antenna for a handheld scanner? (I'm thinking of a small dish, like those used for Sat. TV.) Is it possible?

Also, if it IS possible, is there a way to build the antenna? I realize that you'd need an antenna, cables, BNC plugs, and a dish, etc.

Is it possible?
Thanks.
JT

3888. 235 vs. Mobile 2066 TT

Newsgroup: rec.radio.scanner
Date: 1998-11-08 00:00:00 UTC
From: kegan30317@aol.com
Message-ID: <19981108140953.00811.00001297@ng60.aol.com>
Source record: 138978

Ignoring the fact that the handheld TT is 50 bucks cheaper at RatShack right now than the PRO-2066 mobile and has twice the number of available freqs ....

What, if anything, would I be gaining by using a 2066 mobile rather than the handheld 235 in the vehicle. In both cases I would hook up an external antenna and draw power from the fuse box. The 235 could use a cell phone mount.

Would I gain any sensitivity or reception with the mobile over the handheld?

probably try using the SET commands... specifically:

SET TRACKSLICERPORT=COM2

then your dataslicer should be able to work off com2... ive used mine in
1 or 2 and had the os456 in both and it worked fine for me...

Those are in the reference header! They mean nothing in regard to the
posters identity.
Indeed, the only references to parg in that header are because JMackey
replied to other messages in the thread! You need to read up on some
rfc's...

3911. Software for Uniden/Bearcats scanners

Newsgroup: rec.radio.scanner
Date: 1998-11-09 00:00:00 UTC
From: whorne6146@aol.com
Message-ID: <19981109183155.06389.00001880@ng-fa1.aol.com>
Source record: 138747

I was looking inside my uniden bearcat scanner and notice pins that would match with a parrallel ribbon cable. And also I notice when I bought it that there are some 800 mhz frequencies programmed in there, which because of these two leads me to beliveve that it can be reporgrammed. Would anyone know where I could get the software or anybopdy that has a hacked version of the software please contact me

Thanks,
Whorne6146@aol.com

Source record: 138749

Cruising the web I found a modification someone did to improve the Short Wave receiving capabilities of their AOR 8000 scanner.
In my infinite wisdom I didn't copy or bookmark the page.

If anybody know anything about it, I would greatly appreciate it.

Many thanks in advance
Mike NRA

1. press and hold the keys , 2, 9 and MANUAL simultaneously and turn the power on.
2. Set the power to OFF (should clear 'em all)
This will load 'em with test frequencies
3. Repress and hold the 2, 9, SCAN simultaneously and turn the power on.

WHorne6146 wrote:

> i believe if you turn it off, then hold down the program button while turning

3915. Poor Audio of New Scanners

Newsgroup: rec.radio.scanner
Date: 1998-11-09 00:00:00 UTC
From: Av8tor@flash.net
Message-ID: <727urm$l9t$1@excalibur.flash.net>
Source record: 138751

I was wonding if anyone knows how to improve the audio of the newer scanners?
I hate the bassy sound that most of the new ones have. I have a PRO-34 and
love the "hi-tone" audio, I think it makes it easier to understand. Does
anyone else have the same idea or is it just me?
Thanks
George

Steve,

I just wanted to say congratulations on your role in "Enemy of The State"!!!
Not only did they choose the best person for technical consulting for this movie, but maybe a star is born!
CREDITS: Electronics Store Merchant= Steve Uhrig

If anyone wants to read about the movie that Steve is making his debut in, head over to http://us.imdb.com/Title?Enemy+of+the+State+(1998)

Steve, do you know when it will premere in L.A.?
P.S. Can I get some comps? :^)

Best regards,

Joe

>

What we have here is a man with too much time on his hands and no life. Just another case of a little boy in a man's body. He should have worked his way through the process of being a police officer, if that's what he wanted to do. I don't do drugs or have anything to do with people who do, but I must say if I run across these individuals I surely wouldn't interact with them since they will be the bearer of their own destruction. Another words, Joe Hero, let the bastards alone. Maybe we should tattle on you to the drug dealer and see how good he will make you feel. Christ, grow up already and get off of Sesame Street you'll feel better about yourself.

The Hound

Scott-

Please don't judge us all in the radio field by the poor actions of
these demented people. We had a SERIOUS problem with a user of this
NG a few months ago who since left after losing his internet account
due to abuse. Since then a few sad individuals have felt the need to
take up his cause of distruction.

Just like the Charles Manson thing, there will always be a few
SICK people who support the guilty & want to protect by
attacking those who don't go along with the disfunction.

Reall, what's the issue? Tech plus, but defininition of the FCC, is a
superset of Tech. In fact, I am a tech that was 'bumped' to
tech plus years ago. Legally that should qualify me.

But the law still sucks. A novice can't have the equipment?

Now I know you could argue it makes 'sense', but consider a
novice, studying for upgrade. Or maybe not. He can't have
the equipment he bought for the next class of license?
Before you say that makes sense, lets require all HF rigs
to be locked and only unlocked by the manufacture when
you can PROVE you have the appropriate license class.
Isn't that similar to what you'd be argueing?

Well, good for you John. I certainly hope that it works out for you.

And John, why did you post this to the other newsgroup? They
don't care, and it has nothing to do with this.

>Blake, your paranoia is making you delusional. In an effort make
>yourself
>feel better you have to make up stories about others. You appear to be
>believing your own stories, just like you stories about the Fidonet
>stuff.

John, just a little bit vicious here, aren't you? I have made up no
stories about FIDO.

>You should go back to doing your thing as a two way radio installer
>and stock room clerk.

Actually John, the position I offered you as installer at my shop is
still open, salary to be negotiated. 12 days holiday, 2 weeks
vacation, uniforms, GREAT HMO, and a bonus plan that
can't be beat. We are opening a second shop, and we will
need someone there.

Now, understand, you have to climb towers in this position, as
I explained.

I also need proof of your disability so that I can deal with Chuck
and get the tax credits for hiring someone in your situation.

We are not large enough yet to have a position as stock room
clerk, but as we grow, we might be able to promote you into
that.

And lastly, no, I will not allow you to hang up that paper that
says Master of Communications Technology, as we all know
now what that really represents. Something of a scam I think
is fair to say. You can however, continue to display it
proudly in your own living room.

> >Ignoring the fact that the handheld TT is 50 bucks cheaper at RatShack right
> >now than the PRO-2066 mobile and has twice the number of available freqs ....

First, unless I missed something, the handheld TT that is "50 bucks
cheaper"
is the PRO-91 which has the same 150 channels as the 2066. The PRO-90
has
300 channels and is priced $80 more than the 2066 unless it is on sale,
and
then they're the same price.

> The volume from the 235 is too low for comfortable use in a vehicle. An
> external speaker is not much help. You'll probably need an amplified
> speaker (~$25 from RS). The 2066 is plenty loud enough with just the built
> in speaker and very good with an external speaker.

I'll agree that the 2066 packs more punch but I wouldn't say it "is
plenty loud enough" IMHO ;-) Especially on some 800MHz systems where
the signals can be VERY quiet.

> The 235 display is not lighted except for a few seconds when you push the
> light button. The 2066 display is always lighted.

Yes, a definite advantage. I really wish RS could have had some of the
buttons use backlighting like the BC760XLT for easier use at night.

> Most of the buttons on the 2066 are easier to push in a car than those on
> the 235.

I'll disagree with that. The 2066 buttons, in my opinion, are VERY small
and requre me to use a fingernail for most presses to assure they get
pressed in far enough to register. I can imagine doing this in the dark!

> The 2066 has CB scan. OK... Maybe that's not an advantage!

Well, it is better than nothing! ;-)

> With regard to sensitivity and intermod performance; I haven't made any
> measurements, but they both seem to be about the same with perhaps a slight
> advantage going to the 2066 with respect to intermod.

I'll say that they appear very equal as well. I was pleasantly surprised
to see this as I expected the 150 channel 2066 to be a rebadged 150
channel
PRO-91...which is the poorest performing TT I have tested thus far.

> And finally, the 2066 just looks better in the car.

I'm sure thieves will agree! ;-)

> worth on the used market? This is assuming that these scanners are in
> excellent condition. Thanks, George

The 2035 was closed out (when it was discontinued) around $150 I
believe.
The 2042 (basically a 2035 with some firmware updates and very minor
RF circuit mods) closed out around $200...perhaps a bit lower...before
they were all gone.

But many people ask for higher prices since they bought them before
they were discontinued and therefore purchased them at $400.

Any project involving freq. multipliers, like what you
are sugesting, are not simple nor reliable.
If you need to generate UHF signal from crystal oscilator,
like say 450MHZ, you will need some multiplying
unless you use PLL.
To achieve sufficient phase modulation, you need to
employ some multiplying, too.
Now don't tell me that a complete beginer can tune such
multipliers easily. And anytime you drop the thing on the flor,
the caps or coils may change.
I say lets make one, each by his method, and see which
is smaller, simpler, more reliable and has better modulation?

I'm sure yours will fail.

Best regards,
Marko

Greetings,
I have had a Pro-34 for many years now and always
enjoyed listening to ALL the interesting things happening
around my area... I never got a cordless phone for
obvious reasons but now I bought a Southwestern Bell
Freedom Phone Model FF90xx
Can anyone here tell me if anyone else can 'enjoy' my
conversations with common scanners? Are there more
complex scanners that could? Actually any info would help...
Thanks...
BTW: I always wanted to modify my scanner but I have always
been too scared that I might screw something up and I LOVE
my Pro-34...

> reading way too much in here.
> Have a nice evening
*******Boy, does the name "nobody@home"(mentally) fit you.
Posting/reading/and ISP, auracom.com,and newsguy.com .
Just because I specialize in adoptees and birth parents/missing
persons ,doesn't mean I feel guilt about anything .Do you ? =)
There is normally a reason someone feels like their room/phone etc.
is being bugged.
Since the poster did NOT say the reason and posted this thread to other
NG's ,I thought
I might look and see what his problem is. There's times a person just
gets a feeling about posters. Like a chick I busted for selling phone
sex to pre-teens ,or a guy I busted for selling fake credit cards (in
the names of dead people)to mention a few that we are lucky enough to
have had here. =) And not mentioning all the other weirdo's some of the
other PI's have popped here in this NG. They came to this NG asking for
info. about certain things ,things that they wouldn't explain ,so we run
a check on them . I am NOT the only person in this group that does a
profile.
They are done to see who we are dealing with .And are done as to assure
that we do NOT give info. to nut cases or people that will use the info.
to harm others. It's also done at times to cover our tails for liability
reasons, since we can not see who is on the other end of our monitor
.Everyday (almost =) we get newbie PI's here .Ex LEO with years of
investigative background (that's great) ,but they are not up on
computers or how to do a profile. Yes, they learn fast, but there are
times some of us feel a lil red flag needs to go up for the ones who
want to help ,but don't know who they're
helping =) If you've been lurking for awhile ,you'll notice that days
go by without a post having an answer to it. Could that be that we have
checked the poster out and do not want to answer ? Or a PI will come
back with ,"tell us more info.", then we might help . 70% of the time
,the poster will drop the question, or get pissed because we questioned
his/her reason for the info..
I will go out of my way helping almost anyone ,but NOT scumbags
,druggies,prostitutes ,etc.. I dealt enough with those kinds of people

when I was a LEO.
Now, do I feel guilt about something or am I being careful with whom we are dealing with ? =) I think you read to much into what I said/posted . Maybe you read my post as an outsider ,not thinking of what and who we deal with ,or the liability of giving info. to the wrong person. =)
Hope you have a nice day, friends ? =)
Shelly D.
Reuniting adoptees and birth parents (and other PI work) happy now ? =)

The Mobile has more Auydio Output. but if you use one of those Amplified
Speakers in the Car, You really Should do that anyhow with Any Reciever, there
are basiclly the same in sensitivity etc.

JT> Is it feasable to use a sattelite dish as an antenna for a handheld
JT> scanner? (I'm thinking of a small dish, like those used for Sat. TV.) Is
JT> it possible?

Yes it is. All you need to do is figure out the Focal Point of hte Dish and
place a Scanner Rubber Antenna in that focal point and run the Coax to yuor
Scanner. Rembember to use TOP grade cable like Belden 9913 for any longer
runs, more then 25 foot or so. And TOP quality RG-6 for shorter runs.

R> never come across such a poorly written instruction manual - do others agree
R> is it just my lack of comprehension? PLEASE e-mail responses-Thank you!

It is not you it is the Manual. And it is SO Poorly written someone has
written a replacement for it. They have an Ad on Page 78, Readers market, in
the December Issue of Popular Communications.
For Trunking you Enter the Frequencies AFTER entering trunking mode. Cannot
help with settinjg up trunk groups as I haven't figured that one out yet.
Actualy I am upset as the Department I bought the Trunk Tracker to listen to
has Gone Digital Trunking. :-(:-(**********
But when one does set it up it is nice not to have to listen to the School
Busses and Public Works.

"P> Is it common for a cities trunked system to share that service with tax
"P> and local
"P> businesses , even farmers? My local system is not trunked, but on a recent
"P> trip I monitored a set of trunked channels with a "non-trunking" scanner. I
"P> heard all these on the same freqs.
"P> (I got these from a published list that listed these as sheriff freqs)
"P> I have zero experience with trunking, but was surprised to hear what I
"P> heard.
"P> Perhaps this a common way to defray some of the cost of the system ?

It is common by FCCEDICT. The whole trunktracking thing came about becasue of
a shortage of Frequenct Spectrul in some localities. By Combining all those
users in a locality you can get by with far less individual frequencies. The
whole thing is controlled by a complex computer program with priorities set
so the Police/Fire get top priority and so on down the line. And the
Motorola System, And the others as far as I know will never let you "Step" on
some one, Transmit over their transmission, as you do not get a frequency to
use until lthe Computer assigns you one.
Once you get the "Talk Groups" figured out and assign them to the talk group
memory banks you do not even know those you are NOT interested are even there.

3972. Re: CE-232 + OS456 co-exist?

Newsgroup: rec.radio.scanner
Date: 1998-11-09 00:00:00 UTC
From: mjgilbert.NOSPAM@wcom.net
Message-ID: <36470d93.1330142@news.compuserve.com>
Source record: 138808

No reason they won't, just remember they serve two completely
different functions. The CE-232 makes your computer look like the
scanner keypad, the OS456 is a new computer for your scanner.
I've thought about putting a CE-232 in my 2035 (with an OS535)
but the only thing it let's me do is easily program the box when
I'm not running in OS535 mode, I'm not sure it's worth it, as you
shouldn't need it if you've got really good scanning software on
your computer - once you have that, you'll never go back to
just letting the scanner scan.

It depends on the local system. If it is a SMR (business-type) system, then it is very common. I've heard vending machine companies, ambulence companies, lawn companies, construction companies, security, et al on a local SMR system. Some law enforcement agencies even operate on local business trunked systems.

If its system is owned/operated by public safety/public service agencies, then it isn't that common (at least the systems that i've collected data on.) Most of those systems are used by law enforcement, fire, public works - anything related to the operation of a city or county. There are exceptions to that rule, however. For example, the Jefferson County, Alabama system is also used by the Visionland Amusement Park in addition to local PDs, FDs and the County Sheriff.

Hey, K-Traffic 1650.... I love that station..... Just wish they wouldn't loop the reports so often.... Make newer tapes. Sometimes I hear the same report 4 and 5 times in a row. But hey, it beats other stations reports.

I have a computer running "Windows 95" and I have the Bearcat "BC985xlt" Trunktranker scanner. Now what software do I want to install and use for control of the scanner with my computer? I would love to hear from anyone that has used any of the software available out there. Which ones are good, which ones do I avoid.

And does anyone have any suggestions on where I can buy the software and cable I would need. Thanks

Jim

>Would cheaper equipment like freq.counters and/or hand held scanners
>be of any use for "sniffing"?
>Any opinions and comments you may have would be great!

It is not a do-it-yourself job and virtually all the equipment sold to
the public for debugging is worthless. The skill and experience of the
sweep technician is far more important.

There are many common threats, and each requires different equipment
to detect. Decent equipment is not cheap. My personal slate of sweep
equipment cost $58,000 and I bought cheaply and wise. I could easily
spend half again that much.

Freq counters, diode detectors and common receivers/scanners are
worthless and dangerous if you rely on them and have a false sense of
security. The amateur debugging equipment advertised to the public and
private detectives by the spy shops and related places is a ripoff.

Visit the Articles section of our website and read the several
articles on debugging entitled "This Bug's For You" for a good
rundown. Also visit www.tscm.com for some very good info.

If a professional bugged a room, it would take another trained,
experienced and equipped professional to find the bug. And many
alleged sweep technicians are incapable of finding anything at all let
alone a properly designed and installed surveillance device.

I could go on and on.

4005. ***NEED INFO: IC-Q7A WIDE RX .500-1.9 GHz?***

Newsgroup: rec.radio.scanner
Date: 1998-11-09 00:00:00 UTC
From: teenham@aol.com
Message-ID: <19981108215335.10335.00000884@ng155.aol.com>
Source record: 138853

Hi. I found alot of discussion about how someone made a computer control program for the new ICOM Q7A mini HT which would allow reception of .500-1.9 GHz. I found and downloaded the program. It also says that I need a OPC-478 cloning cable or one for a Yaesu (I don't think I'll be buying one though... I have the schematic for it, if anyone needs it you can email me and I'll send it to you, .JPG format.) The author of this program says alot how you can make the radio tune .500-1.9 GHz which is more than the usual 30-1.3 GHz range.... now my questions: 1. After you used the program, can you still tune .500-1.9 GHz if you are using the radio when it's not plugged into the computer interface (stand-alone)? 2. Does this "software mod" also enable full 800 MHz (I would think not, but who knows...)? 3. How good is the sensitivity on the MW and HF band? Is MW (AM) any good? Is the receiver curcuit the same as on the new IC R2? (Same as the Q7A, but no TX, 400 memory channels, and .500-1.3 GHz RX out of the box.) Please respond by email as well as in the newsgroup because my access to here isn't the best. Thanks!

73
I LOVE THE IC-Q7A!!!
P.S. If anyone has a extra ICOM OPC-478 or one of the compatible cloning cables for the Yaesu laying around that they want to sell (or trade?) for less than what ICOM is asking for one, please email me.

4006. New Casio Digital Camera.....$175

Newsgroup: rec.radio.scanner

Quite an impressive ability to "profile" people from what they write
in usenet posts. It must come as compensation for the pain of being
abandoned by mom, or the guilt of abandoning your own ? Or maybe I am
reading way too much in here.
Have a nice evening

Well, of course the Fourth Amendment does NOT prohibit citizens from overhearing conversations and reporting them to the police. The police are free to use such information as long as they did not participate in obtaining it. But, as has been noted, it was ILLEGAL to overhear it, not because of the Fourth Amendment, but because of federal statutes.

I believe "DOG CATCHER" and related animal control/humane society services are contracted to private agencies, and not handled by government agencies in this area.

One way that I've found a lot of frequencies is to just call up the people and ask them what frequecies they use. I usually get a response.

Is it common for a cities trunked system to share that service with taxi
and local
businesses , even farmers? My local system is not trunked, but on a recent
trip I monitored a set of trunked channels with a "non-trunking" scanner. I
heard all these on the same freqs.
(I got these from a published list that listed these as sheriff freqs)
I have zero experience with trunking, but was surprised to hear what I
heard.
Perhaps this a common way to defray some of the cost of the system ?

Agreed. These are all dwarfed by the R10. Go to my Shack page for some pictures where I have put some of these together for reference purposes:

http://www.strongsignals.net/htm/shack.htm

> Also the Yaseu VX-1R dual-band ham transceiver has wideband receive and is
> used by some as an ersatz scanner; it is tiny as well.

Personally, I'd avoid this one and recommend the R2 as the one to buy! I have reviews of the WS1000, WS2000 and R2 at my site below.

>
> 1. Better sensitivity (especially in the 800mhz area).

Yes.

> 2. Less intermod and resistance to overload when using an outside
> antenna.

No. The BC235 is a pretty robust radio for rejecting intermod while
remaining sensitive. The 9000 has OK rejection but its claim to
fame is great sensitivity.

> 3. Other benefits relative to reception quality that would justify a
> switch.

The 9000 is a much more complicated and flexible receiver covering
HF as well as VHF & UHF. It is more sensitive but also, as a result,
more susceptible to overload (lower dynamic range than the 235).
You might want to consider an IC-R10 or AR8200. Both are sensitive
but offer better interference rejection than the 9000.

> I would appreciate comments from any one who has had the good fortune
> to have used both.

For more info, read up on these radios at my site listed below.

Just another Mackey ploy, when John is caught, like a rat in a trap,
he starts to say he cannot get my posts, so he cannot of course
reply to them. Of course, he can see them, he just realizes he is
caught, and has no explanation.

The good side to that is, that maybe the noise level will die down
now. It is extremely apparerent that John is the common denominator
to all the crap that goes on here. Sheesh. Didn't he say he would
stop when Bill stopped? Bill has kept his part of the bargain, why
not John?

The only thing we have to put up with is the obvious posts from John
that are forgerys, you know the ones, those posts that defend him, or
insult his detractors, that come from places like Dejanews, Hotmail,
and USA.net, with names no one has ever seen before. But those
should die fairly quick, espically when he has PARG.ORG in the
reply line. (Sheesh, that was so stupid of him)

Now, back to scanning. Have you had any experience with the
Optoelectronics add ons for scanners? Can any of them be modified to
work with the Pro-2004?

All of the above. Not to mention the dollar per watt you pay for an
M500, which probably will all be turned off most of the time anyway (skip
noise, people 2000 miles away who could never get back to anyway) so you can
hear the stereo.

From: zacbender@usa.net
Message-ID: <36489206.122772533@news.nwlink.com>
Source record: 138537

I bought a pro 91 from Radio Shack, However I am sorta having
trouble figuring out on whether the 235xlt might be a better choice.
I know the 235, has twice the memory as the 91, but does it have
better or worse receiver dinamics? I only have played with the 91,
but not the 235. I am pretty happy with the unit, but I am wondering
if I could do better as far as receiver performance with the Uniden.
Also I read that the Uniden has longer batt life?

I got the 91 on sale through the flyer, I am curious if whether it is
worth a few extra bucks except for the added mems to spend a little
more cash?

Consumer grade electronics is usually covered under Part 15 rules, which
you will find on a sticker on the back of the TV or whatever. It reads:

This device complies with part 15 of the FCC rules.
Operation is subject to the following two conditions:
(1) this device may not cause harmful interference, and (2)
this device must accept any interference received, INCLUDING
INTERFERENCE WHICH MAY CAUSE UNDESIRED OPERATION. (caps mine)

Don't take my word for it -- look on the back of the monitor you're using
to read this.

> CB's are only legally allowed to broadcast at 4 or 5 watts, which would
> *NEVER* cause problems for tv's.

Nonsense. Consumer electronics are commodities so little effort goes into
making it resistant to outside interference. Remember, it would still
be in compliance with Part 15. I can cause my own TV to "jump" when I
transmit on an HT that was tested with an HP spectrum analyzer and
found to be well in compliance with the regs.

> Only those using 100 watt linear amps would
> have any reason to fear being arrested or their equipment being taken. Those
> linears are illegal to begin with and a cb is not a right in the constitution
> last time I checked...

http://www.arrl.org/arrlletter/96/960712
Search for GREG GODSEY

I can't find the specific quote giving more details on this incident,
but IIRC, the arresting officer keyed down the HT and it desensed his.
Therefore it *must*'ve transmitted on the police frequencies.

(That said, yes, there are lots of idiots running illegal junk on CB
which DOES splatter all over the place.)

> Simple:If some police keys your mic and a nearby tv flickers, then your
> equipment is illegal and SHOULD be taken from you and you should pay a large
> fine for being a smartass.

Please be sure you know your facts before slamming someone. I'm not saying
that what you say doesn't happen, I'm saying that it isn't the ONLY way
this sort of interference occurs. See Part 15 above.

> I hate people who think their rights are superior.

Please check your facts before flaming.

Scanner for sale :

Radio Shack PRO-67 200-Channel Portable Scanner - Good condition

o Triple Frequency Conversion
o Limit or Direct Frequency Search
o Service Bank Search
o Ten Channel-Storage banks - lets you store 20 channels in each bank
o Two-Second Scan Delay
o Memory Backup
o Lockout Function
o 10 Priority Channel
o 10 Monitor Memories
o Search Skip
o Hypersearch
o Data Signal Skip
o Backlight, battery low alert, Battery Save feature
o Built-in charger to charge rechargable batteries when adapter is
used
o Keylock

Reception ranges :
29 - 54 MHz
108 - 136.975 MHz
137 - 174 MHz
406 - 512 MHz
806 - 823.9375 MHz
851 - 868.9375 MHz
896.1125 - 1000 MHz

Still under extended warranty . expires 05/26/2001

Asking : $190 (CAN) or best offer.

Please reply in email or thread if interested. Will deliver for free
in Mississauga and the GTA.

|>

Sorry, but it doesn't work that way. A TV may pick up even a legally operated CB transmitter or other legally operated transmitter. It happens.

Another risk is that the CB or other radio operator may be blamed for problems unrelated to his operation. Many operators have been blamed for TVI or other problems that occur even when they aren't transmitting. Bad as the FCC is, they do at least know something about determining actual sources of problems rather than just blaming a convenient scapegoat.

Then they have gone too far, legally. Wait 'til the
broadcast licensees hear that!

The Feingoild Bill, which snuck through in the last days of the
last Congress buried in the noise level from the Monica affair
and the Starr report, amended the Comm Act to empower local
authorities to enforce ONLY rules against CB overpower and
out of band operation. The Bill also provides that all appeals
go to the FCC.

I stand ready to assist anyone who wants to fight an unjust
action by "locals" on a jurisdictional basis. I would need to
associate local counsel, though, if it's not in California.

> My grief is that, like the Brady Bill on guns, the Feds want the
> local governments to pay to enforce the rules the Feds make.

You should have bigger grief that the "locals" are being
allowed to get into an area in which they are totally
unqualified, untrained, and unequipped.

The Feds did not want this. All knowledgeable communications
enforcement personnel didn't want it. It was a knee-jerk
"you will do what we say and like it" reaction by Senator
Feingold of Wisconsin (not to be confused with Senator
Feinstein of California) overlooking the fact that HIS Senate
has never given the FCC enough manpower which equals money to
do the job right and then they complain that the job isn't
being done. The FCC didn't have enough horsepower to get the
Bill killed a second time (it was killed at the session
before).

The amended section of the Act (47 USC s 302(c)) provides that
the FCC is required to provide training and assistance to the
"locals" on request (fat chance that the Podunk PD will admit
that they don't know the difference between a 2-meter mobile
rig and a CB radio), and you can expect that there will be a
whole slew of appeals to the FCC from local action....all out
of a very limited FCC budget.

> It is not
> the local communities responsibility to enforce federal laws and
> rules.

I've been saying that for decades with respect to communications law.

> Nor should the local tax payers be forced to to dollars that
> should be going to local programs like roads and schools.

Agreed. The money should be given to the FCC to do the job right.

I have never seen a decent explanation about WHY the "locals" wanted this authority as badly as The Senator seems to think or why the needed to get into this area in the first place.

> Thus we need to get the FCC to enforce it owns rules.

Step One -- get Senator Rambo to allocate enough money to the agency to permit this. When I ran the FCC SF office I frequently pounded the table about "gimme 50 agents instead of 2 and I'll get the local problems cleaned up". It fell on deaf ears. All I got was a sore hand and a high number on the "disturber" list.

I say again:

I stand ready to assist anyone who wants to fight an unjust action by "locals" on a jurisdictional basis. I would need to associate local counsel, though, if it's not in California.

Just one more data point -- In Atlanta, I've had TWO* catalogs thrust
into my hand without ever asking for one. Both times were on the
occasion of small purchases (connectors, etc.)

Go figure.

>David

You must be a moron then?
You're saying that a legal/clean cb inside a car/truck or even a home can
cause interference enough to cause a person to report it to the police???

Last time I checked, my cable has a shielded cover. And even if you get the tv through the air, a legally operated cb should cause a problem.

SOMETHING YOU ALSO FORGET, people can use 4 watts and have a clean cb but use illegal attenea's or other devices..
MODULATORS are also used..

Like I said, we're talking about someone causing enough of a problem that it prevents a person INSIDE THEIR HOME [minding their own business] from watching the tv without trouble.

Go ahead and support the cb'ers, you have already made it clear you do.

I hope someone moves into your neighborhood and transmits 24/7 with a 10K watt unit. Gee, wonder if you'd even complain???
NAAA!, after all he has his rights!!

Flamming? When did that happen?

I stand corrected "in the rare instance that people actually use/operate
"LEGAL" cb's"..
I know MANY people with cb's and know a lot of truckers. 99.999999% use
linears at home and in the vehicle.

Not only that, the police are instructed to take the path of least resistance and do whatever it takes to return peace to the neighborhood. This means confiscation of LEGAL CB equipment if it is causing interference and generating complaints. Don't like it? Tell it to the judge. Sure, you can sue the department...but the costs would outweigh the benefits. Just more of the same...excessive government regulation of our lives.

> Flamming? When did that happen?

When you called others "morons," when you wished they had a neighbor
that had a 10kW linear, and proclaimed that they should be fined "for
being a smartass," and in most of your followups -- this last one
excluded -- you flamed.

> I stand corrected "in the rare instance that people actually use/operate
> "LEGAL" cb's"..

...and legal ham gear, and legal marine gear, and and legal GMRS...

A ham might want to run his 1500W linear system in his apartment with
his tuned loop out on the patio. In terms of power usage, it's legal.
(In terms of RF exposure requirements, it probably isn't.) In terms
of all the interference he WILL generate on his neighbors' TV's stereo's,
etc., legally he's in the right. In terms of whether or not his judgement
or his diplomacy is any good, that's a different story.

> I know MANY people with cb's and know a lot of truckers. 99.999999% use
> linears at home and in the vehicle.

That means you know 100,000,000 people who use CBs and only 1 of them
is legal? Methinks you exaggerate a touch.

Cbers are not the only culprits to misuse of equipment. The ham community should clean up their own neighborhood before they find fault in others. So what happens when I put up my Antron poorly hook up my stock 4-5 watt transmitter and the local sheriff comes and takes it away.

I then call my very adept lawyer and have him sue the local sheriff, the neighbor that filed the complaint and maybe the ham operator that help locate my sight.

I think if you check with the techs on this NG most truckers do not have
linears. Either because they change trucks to often and hook up is a pain
or the amps cause to much trouble with the trucks computers. Most I hear
and talk to in and around Chicago do not. What they do in the privacy of
their homes is their business.

When I listen to the cell freqs, I get a high pitch whine when the scanner receives a signal. the whine is non existant when the scanner is silent and scanning, and the whine is unchanged by the power supply (batteries or DC adapter) and only happens on cell phone calls, not on any other band. HELP?!

You need a RIB box and a programming cable.
Go to Texas Two-Way's page and they have the cheapest prices. A RIB should
run you about $100 and the programming cable an additional $60. They will
help you out.

No one has offered what a person is suppose to do with a brand new tv set that
he/she cannot use because of some legal cber next door?

So we just accept this?

Can I assume that all of society runs this way?

If my neighbor wants to have a picnic in my yard it's okay because picnic's
aren't against the law [and just because he is in my yard isn't the issue[??

You guys must admit you've defended an action that isn't worth defending.

So, what are we suppose to do about the problem?

I would assume my right to operate a passive device _inside_ my home is more
to be defended than a person's right to transmitt?

Anyone operating a legal transmitter has just as much right to transmit
as you do to watch your TV. If the TV set is so poorly designed (lack of
proper shielding and filtering) that it cannot reject the unwanted but
legal signal, that is your problem.

It s obvious you haven't a clue about RF interference. Ever hear the
term 'fundamental overload'? Ever think that today's electonic devices
are so poorly designed as far as shielding and filtering go that even a
five watt legal and clean transmitter nearby can cause interference?
You must hate yourself as you seem to think your right to watch your TV
is more superior than someone else's right to operate a legal
transmitter.

Actually their rights are superior. If you cause RFI (interference) then
you are supposed to stop ALL transmissions. You have to prove
that you are not causing the problem. All burden of proof is on you.
Check the regulations, it is all there.

4089. Re: | * | Canada Amateur Radio Study Guide | * |

Newsgroup: rec.radio.scanner
Date: 1998-11-10 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.981110215709.18499B-100000@Ocean.CAM.ORG>
Source record: 138628
Cross-posted to: alt.radio.scanner,rec.radio.scanner,rec.radio.amateur.misc,rec.radio.amateur.policy,can.general

Excuse the cross-postiong, but I didn't start it.

I've never seen the study guide in question, since I"m not running
a computer that can run the software to view it.

But based on the poster's newsgroup posts over the past year or so,
I'd take the website with a grain of salt.

If someone is interested in amateur radio in Canada, they'd do
well to visit the website of the umbrella group in Canada,
The Radio Amateurs of Canada, at
http://www.rac.ca

In French a useful site would be Quebec provincial organization, RAQI,
at http://www.raqi.qc.ca/

A couple of other useful Canadian websites devoted to amateur radio
is the Concordia Amateur Radio Club site at
http://hamgate.concordia.ca
(it has a good explantion of what amateur radio is)

and a website put up by an individual (yes, I can view it and I'd say it's
a good website) at
http://www.cam.org/~dino/ham.html

Another useful website for people curious about Amateur Radio would
be the site belonging to the US national organization, the American
Radio Relay League at
http://www.arrl.org
though the material about licensing would not apply in Canada.

If someone is curious about amateur radio, and has more questions,
they might want to ask in the rec.radio.amateur.misc newsgroup.

Other resources would be to visit a newsstand and pick up a copy
of QST magazine, or perhaps CQ magazine, both of which are devoted
to amateur radio.

Or visit a library and check the section the books on the topic. You
may find that what they have is old (and outdated in terms of license
requirements and even technology, but they will give you a feel for the
hobby), but many will have a recent edition of the ARRL Radio Amateur's
Handbook that will provide an introduction, and probably a lot more
technical information than many would desire to start with.

And by the way, just because someone visits a website or downloads
something does not mean that the site or material is any good. It

might mean that someone wants to see it, and it might turn out that
they don't like what they see.

I should also point out that the "radiotelephone" site may have a lot
of links, but they send you into sections of other people's websites
without sending you to the homepage. So what might look like a giant
effort turns out to be a a lot of links that send you to other people's
websites. You'd be smart to go to the primary websites directly.

And yes, it is fascinating to post a message about pointers to the topic
of amateur radio without explaining what amateur radio is. It's a failure
of a lot of groups and people when trying to reach a wider audience. They
assume others would love to get involved if only they knew where.
Forgotten is the first step, to get them interested in the topic or hobby.

But then, I didn't post in the first place to a number of widely different
newsgroups about a site that might or might not be of interest to the
people in those newsgroups.

Read the shipping policy VERY carefully, they make their money on the shipping. They are a fairly well respected dealer though. I have an 895 from them; it was still a good deal even with their exorbitant shipping cost. It was shipped promptly, and is first rate product, not a repack. 73.

Yes I'm aware of what your saying. What I'm saying is if you properly set your radio up using TVI filters, grounding, antenna high on a mast, chokes and so and so on, then you, yourself can eliminate 95% of the problem. I'm also aware that some TV's and steros are so cheaply made they pickup the dog barking across the street. It's the CB Rambo who sets up junk in the middle of a neighborhood trying to put out 10,000 watts that makes it hard for all of us. I run a 2950 through a 350 HD into a antron 99 (a bleeder so some say) and I have no problems because i simply took the time to set my rig up before I keyed the mic for the firat time.

Jerry

When I look at prices for used radios at new radio dealers I am amazed. Most of the prices are so close to new prices that I can't imagine anyone in their right mind not just buying new instead of used. Am I missing something?

I did. I can't believe just how poor the available software is for the AOR5000. Your program has some interesting features, especially for someone who wants to hack the radio, but it is much too limited for everyday use to control the radio. I've looked at Radio Max, Scan Cat Gold, Radio Manager, Spectrum Master and who knows what else.

The only program that is even remotely worthwhile is Scan Star, but they want $160 of it, which is ridiculous since it is not much better than the shareware versions selling for $40-$50.

I guess the market in AR5000 is too small to make it worthwhile for a developer to create a quality program.

>in, head over to http://us.imdb.com/Title?Enemy+of+the+State+(1998)

>Steve, do you know when it will premere in L.A.?

It is premiering in D.C. this coming Friday the 13th, not in L.A.
Black tie, invitation only. My wife does not want to wear a black tie.
I might wear socks.

Opens in the theaters on the 20th.

I wrote my scene as well as my own lines. The electronic shop where
Hackman buys his secret surveillance equipment is an actual
electronics store in Baltimore where I had been dealing for over 25
years. Broadway Electronics right in front of the market in Fells
Point, for anyone in the Baltimore area. Much of the rest of it was
filmed in Baltimore also, and some in D.C.

Watch for the screen room aka "jar" that is Gene Hackman's secret
surveillance lab. It gets blown up later in the film along with a 5
story concrete building which was a former Dr. Pepper bottling plant
in Baltimore. The jar was inside the building.

I designed the screen room, did the math for mesh size versus
frequency versus field strength at various distances, etc. The set
designers manufactured it so accurately that it worked too well.
Wireless mikes on the actors inside would not radiate out ten feet to
the receivers outside. I ended up stripping the center conductor out
of a piece of coax and hanging it inside as the receive antenna for
the wireless mikes.

The sound technicians were getting all bent out of shape why their wireless mikes wouldn't work. They kept swapping equipment and were beginning to think everything they owned had gone bad overnight. They couldn't believe how effective a properly implemented screen room could be. Surprised me too.

The screen room was Hackman's "bug proof" secret laboratory. The idea of the screen room was to prevent any bugs from being able to transmit their signal out.

You'll see a lot of genuine surveillance equipment in the movie that my company provided to them. Same stuff we sell to governments worldwide. The listening post in the hotel room was a reconstruction of one actually used in one of our surveillances in an Eastern European country only a few weeks before the shoot. You'll also see geniune high end countersurveillance equipment being used by both sides, which was my personal Scanlock and accessories. Yes, the smoke detectors, Christmas tree ornaments, boot heels, belt buckle, clock, lamp, pen and wristwatch and other things I can't remember all actually had operating audio, video or tracking transmitters in them.

Info and more photos on our website.

Rick Kidd can see his favorite slogan in the satellite poster on the wall in the NRO office (National Reconnaisance Office).

After I see the premier this Friday and refresh my memory I'll post more things to watch for. It's been a year since some of this stuff was filmed.

I think you are exaggerating. There are many very good deals on
rec.radio.scanner and elsewhere. Today someone was offering a PRo2006 and a
PRO90 for $350! If the asking price is a bit high, it maybe because the seller
thinks there is a premium attached to a scanner that has no gaps, or may be
throwing in a few extra options. If you want to see ridiculous prices, try
www.ebay.com. People over there obviously have no idea what they are buying,
which I suppose is good for the sellers!

Placing a CE-232 into a Pro-2035/2042 is not worth it. It is better and cheaper to install the PROgramit interface into these models...it will do the same thing.

4112. Pro-39 Scanner (Radio Shack/Tandy/Realistic)

Newsgroup: rec.radio.scanner
Date: 1998-11-10 00:00:00 UTC
From: Mark Pulver <mpulver@research.canon.com.au>
Message-ID: <v11zncjhay.fsf@hodges.research.canon.com.au>
Source record: 138651

I obtained a Pro-39 Scanner from a second hand store, without
a manual. Using http://support.tandy.com/support_electronics/8992.htm
I learned how to program it.

But after a week, all keys except scan/manual/light fail to
work. (The keylock is off)

The trouble shooting page mentions:
Keys do not work or random display. Reset the scanner.

Assuming to reset the scanner by pressing the little hidden switch near the
power point, I tried this with no effect (it did seem to turn the
unit off), except if I press the clear button first,
then it clear the memory. But the keyboard is still dead.

What is the proper reset sequence?
Anyone else seen/know of this problem, and have a solution?

Thanks....
Mark

I think he is despicable.......I don't even watch him anymore.

That is why I'm so upset that our own would bring down Newt,
like the Weekly Standard, Arianna Huffington (she's probably
using the same political insight she gave her ex in his very
expensive & short political career. What a "winner" she is.

Our own did it, and the others are goating. I'm so disgusted.
I think they should just shut down the whole impeachment
hearings & close up shop for rest of this year. I'm not even
watching them. Everything has just gone to "pot"! What a

bunch of losers alot of these people are.

I hate Bill Crystle....who does he think he is as well as the others.

He should just SHUT UP. He says more against Republicans than he does Democrats. And he is really what you would call a "neo-conservative" as is Bill Bennett, another bore.

You definetly need to know what to look for and what it is worth
before bidding too high on ebay. I purchased a PRO-2042 for $188
there, which I consider a very good deal. I have made numerous
bids on 2006's only to see the prices elevate WAY beyond their
actual worth. Try shopping at Hamfests also. I bought a PRO-2005
a couple months back for $150. Hitting another hamfest this weekend...

Two important things to take with you:

1. Cash. A flash of green makes for an easy sale. I never take my
checkbook to these things. Many of the sellers are from out of
town. If you wave what you consider a reasonable amount for the
item under his nose, chances are he might say yes. Everyone
barters at these things.

2. A printout from http://w5gb.nmsu.edu/kc5kto/mods.html
It shows what frequencies each of the Radio Shack scanners covers
and also if it is "modifiable".

Source record: 138666

It helps if you tell us what City and State you live are from. In Southern Califorina you can go to Ham Radio Outlet in Burbank or Orange County, or to Jun's in Culver City. I bought a Comet CH75 Dual Band Antenna today. It measures 15 inches in length and has a BNC connector. The spec's are as follows:

TX: 146MHz band
446MHz band

RX: 118-160 MHz
250-290 MHz
360-390MHz
420-470MHz
820-960MHz

I plan on testing this antenna for a variety os uses. First, for my Icom F4S which I use for REACT (Unit# San Fernando 19) on 462.6750MHz. Next on my Radio Shack Pro--51, to see the difference between that and the stock antenna. Then on my Uniden Bearcat BC350A as a mobile rig. I hope it works well with this, that way I do not have to have any antennas on my car roof, and it will be easy to move from vehicle to vehicle.

Hope this info helps you in your quest for an antenna. Just remeber, the better the antenna, the better the signal. Let me know which one you get, and how well it works.

No. It seems not a single one has been sold world-wide! ;-)

> What do you think of it, is it a good piece of equipment?

Yes, it is good. Alinco has made several improvements to
it since I wrote my review of it well over a year ago.
Great construction and audio. Lots of options. Big battery
sucker though. I suggest getting the AA-shell option and
using alkalines or 1500mAh NiMH cells.

There is only one Uniden base TrunkTracker; the BC895XLT. And I would
suggest going mail-order since you can get MUCH better prices...many
carry it for just over $200 which is a steal for a radio of this
caliber.

> Where is the best place on the internet to buy a radio scanner?

From a reputable dealer.

Just as no one radio can not be the 'best' for everyone, neither is one dealer. And it also depends on what manufacturer and model you are looking at...not all dealers carry all lines. There are roughly 20 brand names totalling about 140 models today.

I would suggest stopping by my Scanner Dealers FAQ and doing a little surfing and self-education:

Yep. I don't recall any "newsmedia exemption" in that law either.
They not only intercepted his private phone conversation but
they immediately used the material for their own profit. The feds
should persue criminal charges and Gingrich should file civil
charges to recover any profits made on what was his private
property. After relentlessly roasting Linda Tripp for a lesser
version of the same thing, ABC should have it's 'nads cut off
for this. "Free" press does NOT mean "without ANY boundaries
or responsibility".

That's not the problem. It turned out to be some internal conflict
with Com2, I couldn't even get my mouse to run off it. I moved my
mouse of to a ps/2 port, freeing Com1 for me . . . .

I went in and bought a $1.99 connector. While the clerk was typing my purchase into the computer, I was looking at the catalog. He said I "could have it if I wanted". You bet. That's TWO free catalogs I have gotten in the last month. One for home and one for work.
Yeah, why not.

4149. UK CD ROM - frequencies

Newsgroup: rec.radio.scanner
Date: 1998-11-10 00:00:00 UTC
From: ScanBase <scanbase@hotmail.com>
Message-ID: <36484642.618D@hotmail.com>
Source record: 138688

```
ScanBase CD ROM Edition 1 - Version 2.00
----------------------------------------
ScanBase CD ROM is currently an HTML based list of frequencies
within the UK and Ireland.

Some of the frequencies are already known and some are not. They
cover almost the full spectrum and are of interest to the scanner
enthusiast as well as HF listners. All HTML lists are fully
searchable. Facilities for printing of individual lists are
also available.

The CD ROM is auto-loading and menu driven. It contains both
Windows 95/98 and DOS versions of the frequency lists. The
shareware is mainly aimed at the higher end users although there are
a couple of DOS based programs available.

The CD ROM is not only about frequencies, but also contains
directories holding shareware directly related to scanning
interests, P.R.O.M.A. lists, browsers for Windows 3.1 and
Windows 95/98 and directories holding descriptions of antenna projects
(D.I.Y. as well as discussions) and a directory with over 300
files on radio modifications (including scanners)

As a bonus, there are also some small electronic projects available
on the CD ROM as well
and hopefully, over a period of time, we will be looking to
increase the availability of
these projects. Anyone who is interested in this side of radio is
welcome to submit
copyright free projects.

**********************************************************************
Price for this CD ROm is only ï¿½11.50p inclusive of Post & Packaging.

**********************************************************************

Just as amazing is the fact that the prices for those old TS-130s and even
the tube final types like the TS-520s are still selling for the same
prices that they were when I got into the hobby in '87. Too bad other
consumer electronics (like computers) dont hold their value like that.

Actually I think I am the only one on the planet who bought one :-)

It's good. You could buy one in canada if the cell thing bugs you
that much - but who cares.

Sensitivity is good, even in the shortwave region. All modes on
all freqs (that's nice). It has some image problems but don't
they all. As was mentioned before it sucks batteries. I really
like the backlit keypad, too many handhelds light the display
but leave you fumbling for the keys. If you buy one in person,
sit down with it at the store and make sure it tunes ALL the
freqs it's supposed to - mine was an early run (ser # < 1000)
and it had holes in it, Alinco was very nice about it but I still
had to send it to them and wait for them to reprogram it.

There is a VERY nice DOS program available from Bruce Pope
to program the radio, you need an ICOM or Yaesu adapter for
it (build one). The software is available at Alinco's web site.

I buy it again.

Question #1....When the scanner is 'searching' for active frequencies during 'AutoStore' programming..does it store only frequencies that actually have traffic at that time..or all available frequencies somehow??

Question#2...I used 'AutoStore' to program my scanner..used 29.0 MHz as my low limit and 956MHz as my high limit. I then selected ALL 10 banks. Needless to say..I now have SEVERAL unwanted frequencies stored on several of the channels. Is there a way to go back and undo my mistake..remove the stored frequencies (but not delete them) without having to clear each one individually using the entering '0' as recommended on page 20 of the operating guide?

Thanks..as you can tell..this is my first scanner! :-)

The City of Lafayette passes the ordinance last night. This ordinance
allows them to enforce any and all FCC regulations. They literary
copied the FCC rule book.

My grief is that, like the Brady Bill on guns, the Feds want the local
governments to pay to enforce the rules the Feds make. It is not
the local communities responsibility to enforce federal laws and
rules. Nor should the local tax payers be forced to to dollars that
should be going to local programs like roads and schools.
Thus we need to get the FCC to enforce it owns rules.

It has everything to do with Amateure Radio, Scanners, or anyother freedoms
because it deals with the Pres of the United States of America SUSPENDING the
Communications Act. If you don't think that is serious, then leave me remind
you. The United States Constitution can be Suspended with just as much ease,
that is very scary. Do you think that that a few dozen radicals in Texas is
enough cause for such drastic measures???

Are they aware of how often that rulebook changes ? and that if they do not now
monitor any changes
and modify their ordenances accordingly, they may find themselves in conflict
with federal law and thus
open to prosecution ?

It boils down to dollars. The enforcement arm of the FCC is very small and the interest of congress is almost nonexistent. Back when the fee for license policy was in effect there was money. All the FCC has to do is start up the fee policy and then use that money for enforcement of the service as the courts required.

The basic requirements for trunking multiple Moto and EDACS systems
are an IBM-compatible PC (8088 or better), and a scanner (just about
any scanner - obviously it must tune the band you want to trunk).

All the information is going on my web site.
I'll post the URL shortly. Sorry for the delay.

Ted,
I own both and like each for their special purposes.
I originally purchased the 235XLT strictly for its trunking capabilities only.
I then realized that regardless of both specs, it blows away the MVT-9000 in
the 150 to 170 MHz range with ANY antenna. This is Police and Marine VHF.
The MVT-9000 is a wide band receiver which does very well in the short-wave
bands (HF), 200 MHZ and up UHF, and especially 800 MHZ when NOT USING
the stock antenna. I think a simple paper clip does a better job.
The MVT-9000 is still a fun toy, and I bet you would learn to love all of its features
you are not planning to use.
I would ask around if anyone likes the new AOR 8200 better then the MVT-9000 first.
I'm sure Rich Wells has plenty of info about both and loves people to bug him about this
stuff.
(Sorry Rich)

Regards,
Eric

nope, you didnt miss anything...if you are a careful shopper and know what your looking at its usually a ripoff unless its something really uncommon that no one has. im sure all the dealers will flame me for this but i own enough gear to supply an entire response team and it was all bought on an average joe's budget.

Interesting. Do you have a copy of the WI ordinance? Which municipality
passed it?

>The danger is that this is what the Federal government wants.
>If they can get the local governments enforcing federalize regulations
>then they can write the rules but make the states and local governments
>pay to enforce them.

Based on my own experience with an illegal ham radio station I'd say the FCC
hasn't the time nor manpower to mess with most cases. The problem was solved
only after a local prosecutor and a US Senator got involved.

>The better way would be to encourage your congressman to
>allow the FCC to keep all fines that are collected from violations
>of FCC rules.

Yes.... if they have the time.

I tried the hack however I wasnt able to pick up a damn thing below 30MHz it read it in the display I even got it down to 60 KHz before it locked but I couldnt receive a damn thing.

Supposedly the Q7 board is the same as the R-2 however from my observations that isnt the case as for the 400 channels didnt get it that high-full it stayed at 200-full 800MHz nope sorry not too mention when I went from say 5MHz up to 30MHz once it passes 30Mhz the mod is deleted and will not display below 30MHz, youll have to redo the mod through the software. one thing I also noticed is if you did the original mod by removing the required diodes the software mod will not work the software reads "IC-Q7A NOT FOUND". The software is good in theory and all but it still needs lots of work....

How about if your rig is set up properly *and* you are knocking out all the TVs? Will the local cops understand why that might happen? Will they have the equipment and technical knowledge? Probably not. Will they be influenced by local politics? (keep the most voters happy) Probably yes. The city gets to prosecute you on unlimited taxpayer funds but you have to pay for your own lawyer. Even if you can convince a judge that those TVs your bothering is their fault, it's still going to cost you dearly. Sounds kind of dangerous to me...

How can you place blame on tv owners [a passive device] when cb'ers are
broadcasting [an active transmitting device]??

CB's are only legally allowed to broadcast at 4 or 5 watts, which would
NEVER cause problems for tv's. Only those using 100 watt linear amps would
have any reason to fear being arrested or their equipment being taken. Those
linears are illegal to begin with and a cb is not a right in the constitution
last time I checked...
Simple:If some police keys your mic and a nearby tv flickers, then your
equipment is illegal and SHOULD be taken from you and you should pay a large
fine for being a smartass.
I hate people who think their rights are superior.

God I love it....for 4 years Gingrich has tried everything he can to
bring down one of the most popular presidents in history and instead
it brought him down....

BWAHAHAHAHAHAHAHAHAHAHAHAHAAHAHAHAHAHAAHAHAS

Now you and the other right wing nuts are attacking your own party
because you are so frustrated that you have nothing else to fall back
on.

Gingrich blames the "24 hour news shows" on television for the
embarassment the GOP went through in the last election. They talked
too much about the so called " Monica scandal" that the people got
sick of it. This would be the "liburrlllllllllll media I suppose.
The truth is he loved every minute they were attacking President
Clinton and so did you.

Chris Mathews, one of the biggest right wing nuts on T.V. was so mad at Gingrich for blaming him that he snapped and was yelling at all the callers to his show that had the nerve to disagree with him. His problem wasn't that Gingrich blamed him for the republican losses, it was because for months he has tried to influence the election but keeping up his attacks on President Clinton every minute he was on the air and it BACKFIRED on him.

I lve it when they begin to eat their own....:)

BWAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAA

Tuesday was a great day.....but a couple days later when Gingrich announced he was resigning I laught so hard I cried.

Think about this. On Tuesday the people in Newts district reelected him. A couple days later he announced he was going to resign.
Kind of like stealing the peoples vote isn't it? What a dispicable man he is.

The "Discone" antenna Radio Shack sells works very well.
I mounted mine about 3' above my roof. I can receive base
station transmissions in excess of 25 miles with full clarity
(no noise). I can receive many mobile radios almost as far
with some noise. Make sure to use a good coax cable as
well. A minimum of RG-6 should be used. Stay away from
RG-58 and other "small" coax.

I live in an area where, for various reasons, antenna reception is pretty shoddy.

In an effort to improve things, I purchased a Gee-Whiz 1000 powered antenna, with an adjustable gain.

It did help with the reception, except when: the computer was on; the coffee grinder was going; the blender was blending; etc.

Did take me a bit to figure out that it was the antenna, but I did immediately realise that *something* in my home entertainment system was not shielded adequately ...

but it MUST, if it is to be sold. You *CANNOT* sell it if it doesn't
have a clean signal -- it won't pass type-acceptance. Yet it WILL (not
can) cause interference.

>> The
>> television receiver SHOULD reject signals (when it can -- fundamental
>> overload is a good example of when it can't) but the FCC doesn't
>> REQUIRE the television to reject unwanted signals. That lets the
>> designers save $0.30 per TV and up their profit margin by that much.

> Same may be said of the radio designers...

Type acceptance still applies. The crappy design still MUST put out a
clean signal. No requirement sits on the TV designers to make them
reject clean signals.

This is so ridiculous -- I'm cutting and pasting this now, because people
keep ignoring it. Read it off the back of your monitor, will ya??

This device complies with part 15 of the FCC Rules.
Operation is subject to the following two conditions:
(1) This device may not cause harmful interference, and
(2) this device must accept any interference received,
INCLUDING INTERFERENCE THAT MAY CAUSE UNDESIRED OPERATION.

the whole reason for the new laws is based on the fact that FCC isn't informed of the interference and police department does direct complainers to call the FCC - therefore the city wants to be empowered to take care of the complaints - dont think that they are going to go out blind and take radio equipment without knowing what they are doing - believe me they will cover their ass.

Even a transmitter that meets all specifications for suprious signals
and harmonics (a clean signal) can still cause interference due to the
fault of the device receiving the interference, not due to the fault of
the transmitter. Very few of todays electronic devices can operate in a
strong RF field without interference due to poor design, filtering, and
shielding. By the way, type acceptance does not guarantee that every
transmitter that comes off the production line will be absolutely clean.
Lots of cb equipment that is type accepted proves that.

Everyone else is. You are doing something wrong, AM (0.5-1.6) is
excelent,
(with the stock antenna) SW for example on 6MHz in AM there is a station
on every 5KHz.

Open the SQ, set to AM and go outside the Hause, if you don't recieve
everything, something is wrong with yout IC-Q7

> Supposedly the Q7 board is the same as the R-2 however from my observations
> that isnt the case as for the 400 channels didnt get it that high-full it

That is a difference in the Firmware and the EEPROM, not the Hardware.

> stayed at 200-full 800MHz nope sorry not too mention when I went from say 5MHz
> up to 30MHz once it passes 30Mhz the mod is deleted and will not display below
> 30MHz, youll have to redo the mod through the software. one thing I also

That should not happen, maybe there is some messup in your EEPROM, try
to
reset the IC-Q7 and upoad your data and try again.

> noticed is if you did the original mod by removing the required diodes the
> software mod will not work the software reads "IC-Q7A NOT FOUND". The software

Not possible, I (and others) have done every possible mod to the IC-Q7,
the
Software UP/DOWNload have nothing to do with that, you are doing
something wrong.

> is good in theory and all but it still needs lots of work....

Say that to my wife and 2 kids :)))))))))))))))

I can spend just 1 more weekend, if more => then i am a single again
:)))))))))
So just one more release, to remove just one bug and make a little
cosmetics.

And the Software IS PERFECT

Right now I would have to say for performance/features the AR8200 would likely take the cake. Keep an eye out however for the new Yupiteru due in February as their reputation is of the highest order for performance and they are supposedly finally going computer control which should more than give AOR a run for it's money.

Most (if not all) of the 900MHz carriers are using the new Motorola FLEX
format. This is not decodable with your POGSAG/ golay setup.

4228. Re: Question- (What is PL?)

Newsgroup: rec.radio.scanner
Date: 1998-11-11 00:00:00 UTC
From: Robert <rc123@globe-net.net>
Message-ID: <364A68C3.BEAE6307@globe-net.net>
Source record: 138417

PL is a term used by Motorola. It means "Private Line" (a registered Trademark of Motorola). A tone, not audible to you, is sent from the Transmitting radio to the receiving radio(s). When the tone is detected, the squelch on the receiver is opened and the message is heard. No tone and the squelch stays closed. This tone helps prevent unwanted signals from opening the squelch on the receiver even if the signal is on the same frequency. Another name for the same sort of thing is CTCSS (Continuous Tone Coded Squelch System) or DCS (Digital Code Squelch).

Some ham radio repeaters use a tone to prevent unwanted signals from keying their transmitter.

The PROBE software that is used with an Optoelectronics interface can decode these tones. They show up like the number you mentioned. When using this software, I can enable the program to only stop when a frequency with the correct tone is heard, to eliminate anyone else using the frequency. The instructions to this software say to think of this tone as a "password" to the receiver. No password, the transmission is excluded.

4229. Bandercom is the best!

Newsgroup: rec.radio.scanner
Date: 1998-11-11 00:00:00 UTC
From: Radio Daze <radiologist@yahoo.com>
Message-ID: <01be0d8d$eec39ee0$LocalHost@default>
Source record: 138418

Just wanted to pass along this amazing example of Bandercom's outstanding customer service record:

Last November, I bought a Yupi from Bandercom. I was somewhat nervous about dealing with a foreign company, but their price was untouchable, so I ordered anyway. The radio arrived, in perfect shape, and it was the best scanner I have ever laid my hands on. Then, a couple of months ago, the radio started to act up. I wrote Bandercom to find out what I should do. They said to send it back to them and they would fix it free of charge. That was great, but I was worried about shipping it overseas.

Despite my fears, I mailed the radio and waited. Four weeks passed, and Bandercom had not received it. That scared me. So I went to the post office, found out that I had forgotten to insure it <groan>, then I had the post office put a tracer on it. A week later, Bandercom wrote that the radio had arrived! No one ever figured out where it was for five weeks, but all was well.

After a couple of days, Bandercom wrote to say they couldn't find anything wrong with it. I replied, explaining that the radio worked most of the time, and the failures had only been intermittent. A week passed, and they wrote me back today. They said that they know something must be wrong with it, but because they couldn't find the problem, they are sending me a BRAND NEW RADIO! That's right, one full year after my original purchase, Bandercom, a company 3000 miles away who does not have to comply with any US consumer laws, is voluntarily sending me a new radio!

Wow! I'm truly impressed with those folks in Finland. Bandercom is the best!

When you picked out that new TV one of your considerations was price.
The manufacturer knowing this, and also to increase his profits builds
that TV at the lowest possible cost. Part of that low cost is not what
is in the TV but rather what is left out. The manufacturer puts in
minimal shielding and designs circuits to use the lowest number of parts
and the least expensive parts. The result is TVs and other consumer
electronics which hears signals which are not meant for them. As for
rights, both the TV watcher and the radio operator have equal rights.
The TV viewer has another right that you are ignoring, the right to
demand properly built consumer electronics, not just the cheapest. Why
should the radio operator be penalized because the TV manufacturer
short-cut the design of the TV? Lets put the blame where it really
belongs in this issue.

> Check the regulations, it is all there.

I think you need to go back and re-read the regulations - and include Part 15
which unequivocall
states that "This device must accept any interference received". I can't thik of
a single piece of consumer
electronics which does not have Part 15 acceptance.

You are correct if the interference is caused to protected services.

I bought an entry-level scanner to listen to police broadcasts while on the road. I have an old-fashioned, white earphone but it doesn't stay in my ear very securely.
Anyone have any sugestions as to what the best kind of earphone to use while driving would be? I recently went to Fry's (a big electronics store in California) looking for a clip-on earphone but they had none. Any good online vendors of scanner accessories? (I assume dual earphones/headphones are illegal as well as not conducive to driving safety, so I'm solely interested in single-ear earphones.)

Simple. If he didn't have that "passive device" he couldn't hear the
interference.

>
> CB's are only legally allowed to broadcast at 4 or 5 watts, which would
> *NEVER* cause problems for tv's.

Wrong! I had a neighbor that threw out his old Zenith TV and replaced it
with a brand new Sony. All of a sudden he can now hear me through it. He
had never heard me before on the old set. He wanted to know what I
changed, and swore I was running illegal power (Another knee-jerk
reaction by the uninformed masses). I countered by asking him what HE
changed. When he told me that he just got a new TV, I suggested that
MAYBE that might be the problem. He then made another brainwashed
consumer statement, by telling me "But it's a SONY, how can that be the
problem?" I then took my 2 meter HT, and my neighber to the local
appliance store, where they had several brands of TV's on display. I
keyed the HT near each one of them and observed the interference. Funny
thing, the Sony was the worst!

And TV's aren't the biggest problem. Stereos are far worse, with long
speaker wires that act like antennas. And cordless phones too. I have a
neighbor that lives 5 doors away, comment to me that he can hear me

faintly in the background, when he uses the cordless. Now I'm running legal power, with an external TVI filter, grounded antenna, and I've checked the output on a spectrum analyzer, and any spurious and harmonic output is well within the -60 dbc specification. MY station is clean, yet we continue to get a bad rap from people like you that think that every RFI problem is the result of illegal power. I'm sure the manufacturers aren't going to try to dispell this rumor, since it will expose their improper RF immunity practices.

> a cb is not a right in the constitution
> last time I checked...

Neither is the right to watch TV.

> Simple:If some police keys your mic and a nearby tv flickers, then your
> equipment is illegal and SHOULD be taken from you and you should pay a large
> fine for being a smartass.

Your lack of RF theory is showing here. A spectrally pure, legal power signal, CAN and DOES cause overload to inferior receiver designs

> I hate people who think their rights are superior.

You should practice what you preach. Since when is YOUR right to watch TV a priority over MY right to engage in meaningful conversation and good natured fun over the airwaves?

Your listed ISP pretty much says it all. Typical liberal mentality, defer responsibility to anyone but yourself, and make everyone else stop enjoying themselves and their hobbies, simply because you are an uninformed consumer and bought the latest "bargain basement TV". Have you ever heard of the phase "You get what you pay for"?

For the $30 price difference between a PRO-90 & 91, you double
the memory capacity. I can EASILY fill 300 channels! There are
more than 1400 channels within a 25 mile radius of my house, per
the Percon Frequency CD I just bought. All three of the radios
you mentioned are built by Uniden. Rich has a great online review
of these radios, plus many more. You can find his website at:

http://www.strongsignals.net/htm/radios.htm

My choice today would be

1. BC235XLT because of the extra battery and slip-in charger.
2. PRO-90, same radio as above but different case and only
one battery. Very easy to buy, just go to Radio Shack.
3. PRO-91, last choice due to lack of channels.

OBTW, for the most part, the PRO-90 and BC235XLT are the
same price today.

Robert

Hello all! Just wanted to drop a line to let all of you know that there is a new way to post your advertisements if you have something for sale, something you are looking for, or just have information that you want to share with others. Kinda like this ole newsgroup. If you would like to join the list and receive mailings from people with their goods for sale, and also to be posted of specials that we may be running at CB City, go to the CB City website at 'cbcity.com' and follow the instructions on the main page. I will do my best at keeping problems to a minimum, by not allowing people to flame others or to try and piss people off. This will not be for that purpose, and never will be. I hope that you all join the list, and if I can do anything at all to help you, please let me know.

If you would like to send email to the list, send it to:

cbstuff4sale@listbot.com

Thanks from all of us at CB City.

Dean

i agree it sucks that they charge for catalogs. i buy less from rat shack now
that i dont get catalogs because i end up doing alot less "day dreaming"
through the pages. no catalog, no day dreaming, less spending, thank you
radio shack.

Yup! It's true. Some consummer devices are so poorly shielded that nearly
anything will cause interference. I know of one case where the electronic
siren on ambulances caused one person problems with her TV. She was
blaming an amateur who had just moved into the neighborhood and our club
interfence team went out to help resolve her problem. Long story but true.

>
> Last time I checked, my cable has a shielded cover. And even if you get the tv
> through the air, a legally operated cb should cause a problem.

EVERYONE knows that even if you are operating legally that you can cause
problems for nearby consummer appliances. Why didn't you?

Did anyone say that? Before you run off at the mouth perhaps you might
like to ask a more genteel question. Try something like "What does one do
if there is an interference problem?"

Since you seem determined to be obnoxious then you could check with the
FCC. They used to have this really good brochure on the that very subject.
If you had asked nicely then many hams would have gone into substantial
detail in helping you with your problem.

Lets set some rules. One, Linda Tripp used conventional
wire recording which can or can not be prosecuted depending
on the state. Two, criminals can be wire tapped only if the
courts issue a warrant. There have to be safe guards.

Now as to Newt and the interception of cell phones. We who
are amateur radio operators and who are scanner buffs have
had restrictions placed on us via the previous Democratic
Congresses in the form of the Electronic Communication Protection
Act of 1986 (ECPA). The first two violations are Democrats
who are spying on political figures. All we want is that these
people be held to the same standards we little guys are held.
Or that the law be repealed.

There it is in a nutshell. As long as the Federal government refuses to
fund the FCC with suffcient resources the enforcement arm will be all but
useless.

Note that when immigration became a high very visible political issue the
INS started to get the resources they had been begging for for years.
Perhaps if the commercial stations and cable outlets were starting to
experience serious disruptions to make an issue of it on the 6 oclock news
then maybe our congressional critters would start to fund the FCC as it
should be.

Thanks for the info, Mr. Kane and 73's

No I have not tested it or installed it. I have a Pro-2004 so I have
no way to do this. The OS456(isn't that name deceiving) when not
enabled is not supposed interfere with the operation of the scanner
when it is not being used. A few people have installed a keyboard
only interface in these scanners and it has the same type of interface
as the ce232 and they have no problems with it. I would not install
a ce232 in the scanner myself. If you install it externally then you
can use it on any scanner that you make the internal modifications to.

Jeff lives in an RF Hell too ... I am **VERY** surprised to hear this
report...

So far we have reports of the R2 swamped with intermod in two locales and
relatively clean in one. Perhaps you should keep tabs on this :-)

The same could be said for your radio. The manufacturer builds
the cheapest set he can, and as a result it leaks RF into all
sorts of bands it *shouldn't* be sending.

That would have to be the radio operator...

snippage

> actually i thought the original post was a pretty good question...what gives
> anyone in here the right to judge this guy 'cause he posted something about
> some shrooms or because of his personal habits at all?

Precisely! I think we get too wound up in judging each other to see
that everyone does things for reasons that are their own. True, there
can be misuse and crime occurring, but for the most part, that's a valid
question... how DORS one tell if a room is bugged?

My take on it: The Magic Slate things are what we used in the Moscow US
Embassy when we found that the rooms had been built with surveillance
gear already in place by the construction crews! We hired locals to
build the place... as IF! What's good enough for the CIA is good enough
for me.

Actually, it is also true that a room needn't be bugged at all for
surveillance personnel to get information. Sensitive laser devices can
read the vibrations from a glass windowpane and translate them back into
speech, from a van parked across the street or from a line-of-sight
window some distance away. Bugs transmitting on rapidly changing
frequencies (matched by the receivers at the other end) can defeat
sweeps... only a highly trained person with state-of-the-art equipment
can truly de-bug a room. Of course that can be a danger also. One
person, convinced he was being bugged, hired a team to sweep his

office... they did. They also PLANTED bugs in their wake that hadn't been there before. they had been hired beforehand by the guy's competitor!

The very best way to avoid being overheard is to go out randomly in the open, talking to the person you wish to pass info to. Go to parks, noisy restaurants, the subway station, wherever. Use far away pay phones. Randomize actions. For example, to choose a meeting place, pick up the morning paper. the first letter of the headline for that day, make it the first letter of the street you choose, changing each day. Things like that. Use the "paperback code" system for a very difficult to crack but convenient code... better yet... don't do anything illegal!! :) What is breaking the law WORTH, ANYWAY? You spend your days worrying, afraid of people, watching your back, and whatever you've gained from what was done is destroyed along with all your peace of mind! Nine out of ten crooks who give themselves away do so out of mistakes made BECAUSE they're so afraid of being nailed. Who needs the aggravation?!!

snippity doo-dah

> for the sake of knowledge i would like to repost the original question as my
> own. i hope my usenet pedigree meets your collective standard...i think you
> will find it spotless. thanx in advance for your replies (not flames).

By the way, that was a *corporate collective* 'you' not a "you" you I was using above! Bst way to debug a room is spend the bucks to have it done properly. But unfortunately, like an AIDS t4st, it's only good for so long... until the room is re-bugged.

Ways to work around bugs? Magic Slates, paper and FELT TIP pens... (no impression on second sheet down!), crayons or chalk on a board, sign language, Paperback Code. Loompanics Press, Paladin Press among others, have lots of info.

Hi,
Have the following I need to part with

1. PRO-2020, classic RS scanner, complete with box, covers 30-50, 108-174 & 410-512
excellent condition. $65

2. PRO-2056, mobile scanner, as new with box and all original accessories, covers 29-54,
108-174 & 400-512, 50 channel hyperscan with built in search ranges.
$99.00

3. Icom IC-R1, complete with manual, antenna and a/c adapter. Continuos coverage no blocks. $275

4. PRO-2 Tunable receiver, covers 30-50 & 138-174, excellent condition $60

5 Standard AX-700/CCR-708A Scanner, has large built-in SDU, very nice radio, covers 50 to 905 MHz, no blocks, comes with manual copy and a/c power supply, $400

Shipping is extra on all items
Thanks
Bruce

>I bought an entry-level scanner to listen to police broadcasts while on
>the
>>road. I have an old-fashioned, white earphone but it doesn't stay in my ear
>>very securely

If you want to listen to the scanner in your car, have you considered getting one of those gadgets that plays through the car tape deck? They cost about $20 but they work well and serves to pump up the volume over road noise.

Highest quality earphone is made by Telex, It's the same one used by TV newspersons.
The earpiece clips onto your collar and an eartube goes into your ear.
Very comfortable, and nobody knows you are wearing it. About $50.

No, both a radio operating in compliance and a TV operating in (part 15)
compliance can cause the TV to misbehave. This isn't hard -- read it
slowly, here, or on the back of or underside of your TV:

This device complies with part 15 of the FCC Rules. Operation
is subject to the following two conditions:
(1) This device may not cause harmful interference, and
(2) this device must accept any interference received,
INCLUDING INTERFERENCE THAT MAY CAUSE UNDESIRED OPERATION.

>> Why
>> should the radio operator be penalized because the TV manufacturer
>> short-cut the design of the TV? Lets put the blame where it really
>> belongs in this issue.

> That would have to be the radio operator...

Read it again. Last sentence.

The radio transmitter is responsible for having a clean signal. The
television receiver SHOULD reject signals (when it can -- fundamental
overload is a good example of when it can't) but the FCC doesn't
REQUIRE the television to reject unwanted signals. That lets the
designers save $0.30 per TV and up their profit margin by that much.

Hello there happy scanners
I have a AR2700 and i just get the CAT-232 serial interface for it.
I can control the scanner very good and i can upload and download banks
and chanels and other programming command's.
But i wand to unlock the scanner to receive the 800 mhz.
I try a program write by Jim Maurer ,but every time i try to upload
the source code the computer freezes.
Can anyone tell me if there is another program to do that???
Or any other suggestions on how to unlock the 800mhz

Thanks

4292. ﷺPay as you goﷺ phone frequencies

Newsgroup: rec.radio.scanner
Date: 1998-11-11 00:00:00 UTC
From: handheldi386@my-dejanews.com

Does anyone know the frequencies of the ﷺnewﷺ pay as you go mobile telephones that are now quite popular in United Kingdom. UK Vodafone and UK Cellnet along with other mobile companies have this service.

If you have any information, please let me know.

Much obliged,

Paul

Source record: 138495

Note that most cordless phones up to 900 Mhz
at best use analog scrambling. This is usually
a speech inversion algorithm which can easily
be monitored with various scanners nowadays.

Probably the one and only type of cordless
that cannot be monitored by air is a DECT
phone which uses time division multiple
access on a single frequency, plus digital
encoding/decoding of the signal.

But even then, it is not that difficult to pick up
signals from the analog line. Here you need some
digital line protocol (like ISDN) to make easy
eaves dropping more difficult, yet not impossible.

I of course, am not the one that Bud was talking about John, and I
have done nothing to create a problem with my ISP. You on the
other hand, seem to be having problems with your ISP again,
Concentric is one of the most responsive ISP's around!

What makes you think it is a sham? I buy and sell radios all of the time and I never use COD. The buyer can always refuse the package and then you get stiffed for the shipping. It takes several weeks for UPS to cough up the dough to the seller too. I would rather get complete contact information and provide the same and place my trust in the person that I'm dealing with. You know what? I've never been burned and not one person that I have done business--and there have been several--has complained. Most of the people that hang out around here are good folks.

As far as I'm aware, non of the TrunkTrackers models have left stateside
(in terms of shipments for overseas dealers). The trunking systems they
use can't be tracked by these Uniden units. So it's doubtful we'll ever
see a UBC895XLT.

You must be the moron. We are not just talking about CB but any radio. How
is your local cop going to know if the readio is CB or not. You will have
to prove that. Do you know that a legal 2 meter rig running at 145 mhz will
cause certain cable channels to get interference. There are two cable
channels here in my area that are on 144 and 145.250 mhz. When I transmit on
packet, 145.070 legally, I interfer with those two channels. A cable system
is not 100% effective in cutting out radio interference. To fix the problem
here the cable company put the same programming on the "B" side cable but on a
different channel.

> bc760xlt...good choice (although not trunk capable)?

The 'true' mobile market isn't very big:
RELM MS180
RELM MS200
Uniden BC760XLT
Uniden BCT-7
Radio Shack PRO-2056
Radio Shack PRO-2046
Radio Shack PRO-2066

I believe the PRO-2056 is being discontinued and with the introduction
of
the PRO-2066, I think the PRO-2046 will be gone soon as well.

All units, except for the new PRO-2066 are double conversion which make
them
susceptible to images and intermod interference. And all the mobile
units are
made by Uniden except for the RELMs.

On paper, the RELM units are a dream. Backlit display and all keys
backlit
as well. But it's double conversion and I found it unusable for
monitoring
in the car due to EXCESSIVE images and intermod. Even though it has PL
capability, that only solves some of the problems...forget 800MHz. The
LCD
is hard to read at night as well.

The BC760XLT has a few keys backlit and optional PL board.

The new PRO-2066 has no backlit keys but is triple conversion and should
offer the greatest interference rejection. My testing thus far has shown
it to behave just like the BC235XLT. I'm pleased with it. But it does
not meet your wide frequency coverage nor backlit key criteria.

If you're looking for good interference rejection and wide frequency
coverage, you might consider using a base station model that can use

12V DC power. But you'll have to give up the backlit keys. To get the keys backlit, you'd probably have to go with a handheld model and worry about mounting options and an amplified speaker for hearty audio.

Sticky little situation isn't it? ;-)

Yes, handhelds are great for portable use when out and about or while
on vacation and, as you mentioned, great for use during power failures.
If you rig up/buy the proper battery, you can power some base station
units with 12 volts should the power fail.

> However, I'm not sure of the speaker clarity. It might be awful easy to
> steal. And it isn't as easy use with the smaller buttons and LED.

Audio is pretty sub-par. I don't consider the buttons that small and
the LCD has great contrast.

> So, I'm back to the base. It is only about 4 pounds. So, it would be no
> problem bringing it camping. It is larger, and therefore the speaker
> should be clearer. But it doesn't run on batteries (although there is a
> DC adapter). Moving it around would be a hassle.

You can run it off of a motorocycle or gel-cell battery. You just have
to wire up your own cable. You could also use the DC adapter to plug
it into the cigarette lighter socket.

> Does anyone have any pros and cons to share on hand-helds versus base
> units.

I think an important consideration when deciding between these models
is all you get with the BC895 for just a bit more $. You get an S-meter,
weather alert, CTCSS search/decode, rotary control and computer
interface.

So get some form of battery and wire up a cable. Use the BC895 at home
from normal AC power. If the power fails, or you go on a trip, you can
use the battery to power it.

Down the road, should you decide you have to have a handheld, the BC235
is currently selling in the upper $100s so it won't be a big expense
and used models should be very attractively priced.

Good luck with your decision!

Jerry, you are missing the point. Even if you have done all that you can do
to clean up your equipment, there are still many "passive" devices out there
that can pick up your so called clean operation. It happens. Just because
you don't know about it doesn't mean it doesn't happen.

Hey, hold it! There have been Osborne machines running DOS 2.0.
Called 'portable' by Osborne himself, it was nicknamed 'luggable' by
those who tried to move it, 'expensive' by those wo tried to pay
it, 'toaster' by those who turned it on for more than an hour, and
'broken' by those who had used it for longer than only a few
months.

Af far as I can remember it featured a real 4.77 mHz 8088 (yes, the
very first one to support DOS, as opposed to the Osborne 1 which
contained a Z80 CPU and (still pretty revolutionary, those days)
not ONE but TWO floppy drives, 5.25", 180 kB each ...

Oh, sweet memories ...

4308. Regency Turbo 800/TS-2 Scanners $65.00

Newsgroup: rec.radio.scanner
Date: 1998-11-11 00:00:00 UTC
From: John Sysak <jksinc@glccomputers.com>
Message-ID: <36499259.64CF04BF@glccomputers.com>
Source record: 138510
Cross-posted to: rec.radio.swap,rec.radio.scanner

I have some Regency TS-2 ,AKA Turbo 800 scanners .
These are out of California Gov. vehicles, like CHP, Sheriff, Caltrans,
ect.
75 Channels, Freq. range 29.94 - 54, 118-135.975 aircraft,
136-174, 406-470,806-950 MHZ.
and preprogrammed NOAA weather including Canadian Freqs.
Units are checked out and in good working order and include copy of
manual and new antenna kit.
These units have the on/off switch jumperd to be on all the time .
$65.00 plus shipping
can e-mail picture if requested

You can call up Radio Shack Unlimited and have the manual sent to you.
I think the number is 1-800-THE-SHACK.

The RS mag-mount and the center-loaded telescopic are great antennas.
If you also want to make an antenna to pull in the 800MHz freqs then
you might look at http://www.northcountryradio.com/discone.htm.

Source record: 138514

David, to be honest, I cannot think of pros for base scanners unless
you mean the real heavyweights (literally, too!) like AOR AR-5000,
AOR AR-7000, iCOM IC-R7100 and iCOM IC-R8500.

These large ones have more stable circuitry, better filters and
hence better selectivity and image rejection, but in most cases
are less sensitive than portables, thus almost forcing you to
have a roof-mount antenna before you will be able to pick up
weaker signals.

Other base scanners basically contain the same hardware as
the portable ones, with the exception only found in the size of
the display, the buttons, the case and sometimes the volume
(however, none are true for the those-days siblings Yupiteru
MVT-7000 (portable) and MVT-8000 (base)).

However, if you have regular ability with ears and hands, and
are not in urgent need for the high-end devices listed above, you
can do equally well with a portable.

If you are disabled on 1 hand you should not choose iCOM,
since their function key is on the left side of the scanner and
operates only when pressed simultaneously with other keys

When audio volume is a concern you may eventually
consider a headset, most ear plugs and headphones work
fine with portable scanners.

Hope this helps. Good luck and brgds from Aad van Strien,
who hardly ever uses his base scanners (AOR AR-3000
and iCOM IC-R7100) anymore as a scanner, but only as
a receiver tuned to 1 single frequency.

Hello All, With the pending air, ground, and sea strikes against IRAQ in the next few days or weeks its a good time to start posting frequencies, both HF and UHF that might be used in IRAQ and here in the states by planes and ships in route to the area. I just heard the Clinton is about to sign an order to allow F117's, B52's and other hardware to start the trip. What are good freqs here in the States to hear F117's in route to the area??? I seem to remember reading that if you store <30MHz freqs in a memory
channel, then use the radio standalone to access that channel it
works, even though the display does not show you the <30MHz freq.
I'll have to test this when my new Q7A shows up - hopefully today.

4321. Need POCSAG/GOLAY pager decoding system.

Newsgroup: rec.radio.scanner
Date: 1998-11-11 00:00:00 UTC
From: dolphinride@hotmail.com
Message-ID: <72cdbbrss1@nnrp1.dejanews.com>
Source record: 138523
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.swap

I have been trying with limited success to implement a pager decoding system. I have used Message Tracker and one other sortware package. I have little luck to speak of trying to decode anything over 512k baud. I have trouble with pagers that operate in the 900mhz range also. I was told that this could be improved by hooking the interface directly into the discriminator output of the scanner. I am very hesitant to try this procedure myself, especially since I have received several different sets of instructions on how to accomplish this with any of the scanners I have.

I have a PRO2006 (w/os456), a cell capable 200xlt, and an AR8000. I am interested in trying to get this project rolling again. I expect accurate decoding at all common baud rates (up to 2400 or 9600, I beleive). Please tell me what you know as far as getting the interface hooked up to one of these scanners properly, and any advice as far as software. Any help appreciated

>The real scary thing here is that the average police officer will make the same
>(totally wrong) assumption.
>
>"Where's that big 'ol CB RAMBO??"
> "I wanna hear him TALK TOUGH!!"

Several points:

1) The city council passed first reading last night. The final vote is December 7th. The news article is here:

http://www.jconline.com/news/news1110/1110l04.html

2) In reference to the points above, I'm afraid that's exactly what will happen. FACT: a legal radio can cause interference. FACT 2: (as someone pointed out) the TV must accept that interference. FACT 3: If the FCC informs the radio operator theat he is causing interference, that operator must comply with whatever the FCC tells them to do. (see below for more info)

OPINIONS: No, that does not mean people will stop complaining. The police won't have any idea what they are looking at, or whether it's legal. The minute they arrest a legal operator, or an amateur (because they have no idea what the difference in equipment is), the excrement is bound to impact the air circulation device in a big way. I might not want to hire my own lawyer, but I'll bet there are some folks who would jump at the chance to sue the city.

3) It's not the city's job to enforce federal laws. They don't have the time or the training. Don't get me wrong, I have friends on the city police force. I think they do a great job. I also think they don't need this cr*p.

4) PLEASE CONFINE THE DISCUSSION TO A RELEVANT NEWSGROUP. This has been splattered all over the usenet, and really only belongs in rec.radio.cb, and maybe a couple of other radio groups. Did anybody look? talk.politics.guns?!?

The relevant cites:

Code of Federal Regulations
Title 47

Fact 2: Part 15, Subpart A, ï¿½ 15.19 Labelling requirements, a.3:

(3) All other devices shall bear the following statement in a
conspicuous location on the device:
This device complies with part 15 of the FCC Rules. Operation is
subject to the following two conditions:
(1) This device may not cause harmful interference, and
(2) this device must accept any interference received,
including interference that may cause undesired operation.

Fact 3: Part 95, Subpart D, ï¿½ 95.423 (CB Rule 23)

What must I do if the FCC tells me that my CB station is causing
interference?
(a) If the FCC tells you that your CB station is causing interference
for technical reasons you must follow all instructions in the official
FCC notice. (This notice may require you to have technical
adjustments made to your equipment.)
(b) You must comply with any restricted hours of CB station operation
which may be included in the official notice.

Look it up yourself:
http://www.fcc.gov/wtb/rules.html

"> Uniden model. Thanx

I believe they only sell ONE model here in the US. It is the BC895XLT. And
since Communications Electronics has a coupon in the December issue of Popular
Communications for $125 OFF Making their price $194.95, Plus shipping of
course, I would use that as a Benchmark. IF the local dealer cannot come close
to that Price I would pass on any deal.

Here is the email & response from UNIDEN to an inquiry I made as to the
advent of an EDACS/Ericsson trunktracker
.
> Is there any truth to the rumors that Uniden will soon announce a
> scanner that receives and tracks both Ericsson/Edacs and Motorola
> trunked systems. If not, is there a trunk tracker on the horizon which
> tracks only Ericcsson/Edacs trunked systems?

UNIDEN RESPONSE:
The Trunking scanners that are out on the market will only
work for the analog Motorola system. At this point we are not coming out
with any model that will work on the GE / Ericsson system.

I

Thank you

> cause interference enough to cause a person to report it to the police???

Sorry, but you are the moron.
You obviously know nothing about the physics of electronics and radio ommunications.

> Last time I checked, my cable has a shielded cover. And even if you get the tv
> through the air, a legally operated cb should cause a problem.

What does a shielded cable have to do with anything ??
The screening is there to maintain a constant impedance of the cable as it passes close to things with different dielectric properties. It is NOT to stop the signal "leaking out" as many
people (yourself included) seem to think. Ever hear of balanced feed lines ? These have no scree
and radiate nothing.

It is usually the TV which is the problem, the are poorly designed and constructed and susceptible
to interference fromalmost anything. This is why the FCC will take no action provide that a transmitter
is operating correctly.

> SOMETHING YOU ALSO FORGET, people can use 4 watts and have a clean cb but use
> illegal attenea's or other devices..

This will raise the EIRP a bit, but if the signal is clean will make no difference.

> MODULATORS are also used..

Dimwit !!! dou yho know what a modulator is ????
A modulator is what puts the signal onto the carrier wave.
Without a modulator no information is carried on the signal.
GO buy a book on radio communication basics 101 !!!

> Like I said, we're talking about someone causing enough of a problem that it
> prevents a person INSIDE THEIR HOME [minding their own business] from watching
> the tv without trouble.

>
> I hope someone moves into your neighborhood and transmits 24/7 with a 10K watt
> unit. Gee, wonder if you'd even complain???
> NAAA!, after all he has his rights!!

You have the right to demand of TV manufactureres that they produce equipment which is capable
of rejecting reasonable levels of signals outside the reception frequency. They don't. Their
problem
for building it that way, and your problem for buying the cheap junk - you go taken - well - tough
luck
now stop tying to make YOUR problem into someone elses problem.

And if you are going to try to do so at least EDUCATE YOURSELF - its fine being a moron talking to a bunch of other council morons, but in the real world illiteracy and stupidity don't
help
your case one bit.

Philip

Diaper_Reagan wrote:

> I would assume my right to operate a passive device _inside_ my home is more
> to be defended than a person's right to transmitt?

You would be wrong.

Correctly designed equipment will not suffer this interference.
Look on the back of your TV etc - there is an FCC notice which explicitly states that you MUST accept interference. This is because the consumer electronics industry
refuses to spend the extra 10c to design and build equipment which will reject such interference.

The FCC allows sub-sandard equipment to be built and sold provided that it carries those
warning labels (what ? you never realised that they were even there ?? - caveat emptor).

You accept those terms when you buy it. If you don't like it, buy correctly designed and built
equipment (and good luck finding it - the consumer electronics industry has ensured that you
won't).

How can you place blame on tv owners [a passive device]

A TV set a passive device? Where'd you get *your* EE?

>when cb'ers are

> broadcasting [an active transmitting device]??
>

So? A TV set not designed to receive a radio signal outside its passband SHOULD NOT receive any such signal. This should be required by FCC regulation, but the manufacturers have successfully lobbied against such requirements at the FCC. So no consumer product is required to be immune from RFI. Is that the fault of any radio transmitter whatever the service? Not just no, a thousand times no! If the transmitter can be shown to be clean, but still affects a TV with RFI, there's nothing more that transmitter owner can do.

That is right, and often these illegal transmsitters/amplifiers are transmitting spurious trash on a wide range of frequencies. So they should be taken off the air. And what has any of this to do with ham radio?

Dick C

> How can you place blame on tv owners [a passive device] when cb'ers are
> broadcasting [an active transmitting device]??

Simple. ANY transmission can cause receiver overload. The transmission can be perfectly legal both in frequency and power. Yet, receiver overload can occur. In that case the owner of the receiver (ie TV) is responsible for making any/all alterations necessary to stop the interference. While the person producing the transmission should assist in the interest of public spirit there is no law that requires them to lift a finger to help. Normally this isn't a problem since the simple and free advice that they check the cable and connections on their antenna and cable, and if that does not solve the problem to add a cheap (under $5) high pass filter (can be purchased at almost any TV store) to their antenna cable.

> CB's are only legally allowed to broadcast at 4 or 5 watts,

4 Watts.

> which would
> *NEVER* cause problems for tv's.

Wrong. Such a power level can produce interference even with an omnidirectional antenna. A Yagi (or other directional ant.) would be perfectly legal and would concentrate the power in a particular direction extending the range in which interference is likely possible.

> Only those using 100 watt linear amps would
> have any reason to fear being arrested or their equipment being taken.

Wrong. Anyone using more that 4 watts would have reason to fear being arrested and their equipement taken since that is the MAXIMUM legal power for that band.

>Those
> linears are illegal to begin with

Wrong. Most of those linears are legal, just being illegally used on the wrong frequency.

> and a cb is not a right in the constitution
> last time I checked...

So you think no one should have access to radio communications?

Sorry, but while rules have to exist to govern the even and fair use of this public resource, to deny that we should be able to use it is silly. It would be like having a highway that no one can drive on.

> Simple:If some police keys your mic and a nearby tv flickers, then your
> equipment is illegal and SHOULD be taken from you and you should pay a large
> fine for being a smartass.

Well, shows how much technical experience you have. A PERFECTLY legal system CAN cause interference in certain situations, even those in which there is NOTHING wrong with the installation or operation of the CB station. Such as reciever overload, bad ground connections on the TV's coax. poor selectivity in the TV, ect, ect, ect. All of which can produce TVI, despite the CB being perfectly and totally legal in all respects.

> I hate people who think their rights are superior.

You mean like people that think their right to watch TV is superior to another's rights to use radio communications?

Yes.

>
> Last time I checked, my cable has a shielded cover.

Have you checked to see if all the connections are clean and tight?

Have you checked to see if the cable is damaged?

If not then you don't know if that shielded cover is really grounded, if it's not then it doesn't shield anything.

> And even if you get the tv
> through the air, a legally operated cb should cause a problem.

I'm assuming you mean shouldn't. Normally no, a legal CB shouldn't cause a problem, but exceptions exist. What I would do, rather than bitch that everyone should halt their activity because of YOUR problem. Is to first INSURE that you DO have a problem. First, check, clean, and tighten all coax connections. Inspect the coax cable for signs of damage (including being crushed). Add a high pass filter to your coax cable. If none of these work attempt to redirect your antenna (which is directional) and see if you can obtain your signal from a different direction. TV signals are often bounced from natural and man-made structures. CB on the other hand is low enough in frequency that it does not reflect as much. If you can NOT solve the TV interference, borrow a CB from a friend and when you are getting the TVI check the channels to see if any transmissions are matching the interference on your TV.

It's also possible that a local ham operator could be causing the interference. Both 10 meter & 11 meter (CB) can cause interference particularly around channels 3 and 4.

However, if you can identify the sender (or can talk to them) inform them POLITELY that they are causing interference with your TV, and could they attempt to change to a different channel/time, or at least work with you to see about what can be done to eliminate the interference. Most people will work with you, if you are polite. If you get snotty with them, then expect the same in return. Remember it is entirely possible that their legal transmission could be causing you interference, and if their transmission

is legal they don't have to do a thing to help you. Most will (particularly hams), but politeness and friendlyness is the key.

As a last resort you should inform the FCC office closest to you giving them as much information as you can provide. Dates, times, names, frequencies or channels, ect. Then don't expect an immediate response.

> SOMETHING YOU ALSO FORGET, people can use 4 watts and have a clean cb but use
> illegal attenea's or other devices..

You also forget that even at 4 Watts a perfectly clean CB can cause interference in a less than perfect TV.

> MODULATORS are also used..

Yep. However, you don't know this. All you really know is that you have interference and suspect that it's illegal CD. It may, it may not. It might be as simple as cleaning your coax connections or it may need the intervention of the FFC to fix, or it may be the result of a legal transmission at which point you have to try other solutions. Check your local ham group for help, suggestions, ect. They have the knowledge, equipement and resources to determine the causes and potential solutions.

> Like I said, we're talking about someone causing enough of a problem that it
> prevents a person INSIDE THEIR HOME [minding their own business] from watching
> the tv without trouble.

It may also be your set, cable, or antenna. Have you even CHECKED you cable?

Probably not.

Hint: while maintaining a CB helps prevent interference, so does maintaining your TV installation.

> Go ahead and support the cb'ers, you have already made it clear you do.

No, you are jumping about like a cat with it's tail caught in a box. You need to calm down and determine the cause (not just what you think it might be), and research solutions. Many interference problems can be fixed simply by preforming a bit of maintaince of the coax, or possibly adding a high pass filter. First check to see if there is anything YOU can do to eliminate the interference. If that fails attempt to track down the source, working with them may all both of you to obtain a solution suitable to both of you (which may as simple as not transmitting during the big game), ask for help from the local ham group (for either of the above), last report the precise details to the FCC and hope (and endlessly wait) for them to produce a solution. Needless to say the first 3 are most likely to produce a quick result than is the last.

> I hope someone moves into your neighborhood and transmits 24/7 with a 10K watt
> unit.

Why?

> Gee, wonder if you'd even complain???

Probably.

> NAAA!, after all he has his rights!!

True, but then he is acting outside his rights. A factor that you have yet to even confirm. His actions may be legal and he is totally within his rights. Now what? Didn't you just bitch about people that thought their rights should be superior to others?

Well, first insure that the problem does not rest in YOUR installation.
Next, add a high pass filter to your system. Finally work WITH the legal
CBer to resolve the problem. The 1st two will eliminate over 98% of TVI
caused by legal CBs.

> So we just accept this?

Nope, but you don't demand that he stop his legal activities either. He has
just as much right to transmit as you have to watch. So who should be
right, both or neither.

You don't normally have to accept it, but you also don't necessary get the
best solutions by getting in a fight with your neighbor over it either.

> Can I assume that all of society runs this way?

Yep.

> If my neighbor wants to have a picnic in my yard it's okay because
picnic's
> aren't against the law [and just because he is in my yard isn't the
issue[??

No that is not the issue. Wait, let's make it similar. He's having a picnic
in his yard. You are a vegaterian, he's grilling hamburgers (in his yard),
the smell is blowing down wind to your yard. You don't like the smell. So
what should you do? Demand he no longer have picnics in his yard, go inside
out of the smell, or attempt to coordinate your activites so that he isn't
grilling hamburgers while you are trying to relax in your yard?

You can't have your own way all the time. You are both engaged in lawful
activites, and sometimes that produces interference. You don't fight over
it like children. Rather you work together to resolve the difficulties (and
problems) like the grown up adults you should be.

> You guys must admit you've defended an action that isn't worth defending.

You should admit that sometimes another's lawful activities are going to
interfer with what you want, and that is a fact of life. You can either
learn to deal with it in a intelligent adult manner, or go around whinning

like a small child. The choice is yours.

> So, what are we suppose to do about the problem?

First see what you can do at your end to end the problem. Then ask your neighbor what he can do to end the problem. If that doesn't work you both ask for advice for a solution to end the problem.

Doesn't it make you wonder when you have to explain such simple adult concepts to someone that should already know them?

>
> I would assume my right to operate a passive device _inside_ my home is more
> to be defended than a person's right to transmitt?

Wrong. Your device is NOT passive. It too can cause harmful interference if it is not functioning properly. However, to answer your question. It does not matter if the set is passive or active. HIS rights are just as important as your rights. When problems develop as a result of both of your legal activities, then you WORK TOGETHER TO RESOLVE THEM.

I understand that present Federal law requires that collected fees go to general revenue, not to fund the agency which collected them, and that all agency expenditures be budgeted by legislative act (passing a new law) annually. So it would take a change in Federal law to make it possible for the FCC to collect fees and keep those fees to fund *any* of their operations, including enforcement. Not a likely prospect since other agencies would want to follow suit, and a real nightmare of oversight could easily occur. Imagine what some bureaucrats could do with the authority to collect their own funding from those who they deal with daily.
When viewed in this light, the scope of the problem becomes more clear

Dear Scanner Enthusiasts,

You are welcome to visit Mercer County Pennsylvania's online WebScanner. http://genesis.infonline.net/scanner It is online LIVE* 24 Hours a day and covers most of the public service bands in the Mercer County area, Special weather reports and a HUGE online shoulder-patch encyclopedia for patch collectors or anyone interested in patch insignias.

We are welcome to comments and suggestions and certainly welcome any image donations to the patch library. We are looking to upgrade our online scanner hardware and add additional feeds to our service. If you would like to donate any scanning equipment to our non-profit project, please write! We look forward to putting more stations and more bands online.

The broadcast is in Real Audio and you will need this to hear the scanner radio. The player is available for free from http://www.real.com Thanks for all the kind comments from fellow enthusiasts listening to our scanner feed. Happy Scanning!

* - there is approximately a 4 to 5 second delay in re-transmission to the Internet ... I know someone would have stated ... "It's not really live"

-Dirk,(N3TTI) Sr. Technical Engineer
Infinity Online Internet Services
Operations: webscanner@infonline.net
Patch Submissions: patch@infonline.net

4347. $195 for BC895 XLT at CEI...What's Wrong?

Newsgroup: rec.radio.scanner
Date: 1998-11-11 00:00:00 UTC
From: egerter@NOSPAM.voicenet.com
Message-ID: <QJ622.62$Yy5.2218274@news2.voicenet.com>
Source record: 138558

I'm shopping for a 895xlt and came across the CEI web site.
They're asking $195.

Would this be a grey market item? Has anyone delt with this
company?

Any advise is appreciated.

Adam

4348. Pros and Cons

Newsgroup: rec.radio.scanner
Date: 1998-11-11 00:00:00 UTC
From: David Siemen <dsiemen@novagate.com>
Message-ID: <72at9g$at6$0@205.138.138.3>
Source record: 138559

I have a dilemma. I like both the Uniden 235XLT and 895XLT. One is a mobil hand-held, and the other is a base unit. This will be my first scanner. But which to choose?

I like the mobility of the hand-held, although I'm wondering just how much I will take it places. I think that there is an AC adapter so it can be plugged in. Would sure be nice during a storm when the power is out. And it would be so easy to take with me outside while working in the yard and even out on the boat fishing.

However, I'm not sure of the speaker clarity. It might be awful easy to steal. And it isn't as easy use with the smaller buttons and LED.

So, I'm back to the base. It is only about 4 pounds. So, it would be no problem bringing it camping. It is larger, and therefore the speaker should be clearer. But it doesn't run on batteries (although there is a DC adapter). Moving it around would be a hassle.

Does anyone have any pros and cons to share on hand-helds versus base units.

Thanks!

David Siemen

>

Jerry, do you not know that NO rule is in effect that requires the manufacturers to build consumer devices so that they are immune to RFI from ANY source? Do you not know that many, even most such devices-TVs VCRs, telephones, and many others are routinely affected by radio signals even though they are NOT radio recievers, not designed to be, nor intended to be? Don't you know that they COULD very easily and cheaply be made to be mostly immune from normal overload and RFI interference by the manufacturer merely adding a few cents worth more parts, but that is not required by law or regulation, so almost none does? That the FCC has the authority to require this of the manufacturers but has declined to do so? That the FCC, in conducting on-the-air RFI tests with operating ham radio stations discovered that virtually no RFI case was solved by the amateur reducing power from full legal limit to 100 watts?
That the FCC has received so many unwarranted complaints from consumers of RFI, using up so many hours of scarce employee time that they have adopted a policy whereby they don't even respond, rather they refer the complainant to a local TV or electronic serviceman?

Just what DO you know about this subject Jerry?

Legal? No. Are the inspectors knowledgeable enough
to know if a particular scanner would be illegal in the USA?
Probably not. You have to decide if the risk is worth it.

Don't be so quick to judge. COD's aren't that common on the swap
newsgroups, I use them all the time.

If a seller ships COD and the buyer refuses to receive and pay for the
package, the seller is stuck for the shipping cost! I know, this happened
to me several times selling just one radio!

There really isn't a good way to protect the buyer and the seller. It is
unfortunate. You just have to establish some trust in a deal.

I currently have a pro26 and a bc235xlt and I love both of them. I am ready to mount a mobile scanner in my car and I'm looking for recommendations for a very good mobile unit that has back lit buttons and coverage in the 800 range. Is there a trunktracker made that has the capability of 29-1300 mhz with the obvious gaps, but has back lit buttons and gets great reception without crossing the 300-400 barrier (US $) What do you know about the uniden bc760xlt...good choice (although not trunk capable)? I've seen these for 100-150 used, is it worth that? I'm open to recommendations

4372. Use Caller ID as an EMWIN demodulator?

Newsgroup: rec.radio.scanner
Date: 1998-11-12 00:00:00 UTC
From: rbw <rbw@testengeer.com>
Message-ID: <364b638d.0@news>
Source record: 138133
Cross-posted to: alt.ham-radio.vhf-uhf,alt.radio.scanner,rec.radio.scanner

Here's an interesting idea to kick around in the newsgroups.
Let's see if we can shed some light on this subject, please.

I understand that CID (Caller ID) and EMWIN both use
a Bell 202 protocol. Could a Caller ID unit be used as an
EMWIN demodulator? Does anyone have suggestions for how
it would need to be modified? I presume the output from the
CID demodulating chip is TTL and would require a TTL to RS-232
level converter like the MAX232 or similar chip. Could anyone
some suggestions on how to interface the audio input? For example
would you need an isolation transformer or would a simple coupling
capacitor be sufficient? Where (which pin #) would I tap for the raw
data output from the demodulator chip? Would the TTL output need
to be inverted before converting to RS-232 serial output?

Does anyone have familiarity with any Caller ID units or the chips
used for Caller ID demodulating?

If you are not familiar with the EMWIN broadcasts by NOAA run a
search for "EMWIN" on YAHOO or any other search engine. You can
follow the links and learn everything you may want to know about the
system. By the way, old Bell 202 phone modems make excellent
EMWIN demodulators.

If you can contribute to this discussion, please send me a response.
Thanks.

True but there is very a nice piece of windows software at
http://www.mntrsoft.com
to do the same thing.

4382. YUPI MVT 7100 Handheld for sale

Newsgroup: rec.radio.scanner
Date: 1998-11-12 00:00:00 UTC
From: Adam Hicks <adam.hicks@virgin.net>
Message-ID: <72foo4$8k7$1@nclient1-gui.server.virgin.net>
Source record: 138143

FOR PRIVATE SALE

YUPITERU MVT-7100

The MVT 7100 is the top of the line product from Yupiteru. Its' performance exceeds that of any other hand held scanner that is currently available on the market. Unless you wish to control your scanner from an external computer, it is by far the best choice if you are looking for excellent performance on VHF/UHF plus tolerable results on HF.

It has full, continous coverage from 530khz to 1650MHz. Any mode from AM, Narrow FM, Wide FM together with Upper and Lower sideband. Increment steps vary from 1khz up to 100khz although when LSB or USB is selected then increment steps as small as 50Hz can be used allowing for true and accurate tuning of SSB stations such as transatlantic aircraft.

The MVT 7100 scans at 30 channels a second, fast enough to keep up with all the action, and with 1000 channels that can mean a considerable amount ! If you have a mix of frequencies in different modes and you just want to scan the airband frequencies (AM) you can even tell the MVT 7100 just to scan those channels that have frequencies stored in AM mode. This saves you having to "lockout" all the channels in other modes.

10 Search banks are also provided into which the user can program upper and lower limits to search between in any chosen mode and increment step. Individual memory channels can be "locked out" if desired as can up to 500 individual frequencies that when searching may cause the scanner to stop if they contain signals or interference.

Whilst many handheld scanners now have an attenuator to reduce the level of interference on certain frequencies this can usually only be turned on or off, thus affecting all channels. The MVT 7100 has an attenuator that can be switched on or off for each individual channel.

The LCD display shows the Frequency, Mode, Increment Step, Channel number together with any facilities in use and a 8 segment Signal Strength meter. The backlight not only illuminates the LCD screen but the key pad as well.

SPECIFICATIONS
Frequency Coverage: 530KHz-1650MHz
Modes: AM, NFM, WFM, LSB & USB

Increment Steps: 50, 100Hz (LSB/USB only), 1, 5, 6.25, 9, 12.5, 20, 25, 50 &
100KH (50 & 100KHZ only on WFM)

Sensitivity:
0.53 - 2MHz:
AM: Less than 10uV(S/N 10db)

2 - 30MHz
AM : Less than 1.5uV (S/N 10db)
LSB/USB: Less than 1.0uV(S/N 10dB)
NFM : Less than 1.5uV (SINAD 12dB

30 - 100MHz
AM : Less than 0.5uV (S/N 10db)
LSB/USB : Less than 0.5uV (S/N 10dB)
NFM : Less than 0.75uV (SINAD

1000 - 1650MHz
NFM : Less than 1.0uV (SINAD 12dB

Memory Channels: 1000 (1o banks of 100)
Search Banks:10
Search Pass Channels: 500
Scan Speed: Approx 30 channels per secon|
Search Speed: Approx 30 steps per second
Delay: Approx 2 seconds (standard)or 5 second

Dimensions:644(w)x155(h)x38(d)mm
Weigh: 320grammes
Antenna Connection: BNC Fitting

Rubber duck antenna in additional to standard telescopic

Sensible offers please...

Latitude and longitude are usually in DMS or DM.

DMS format: 32° 32' 32"
DM format: 32° 32.32'

Since you know that there are 60 seconds in a minute:
DMS-->DM
Degrees and Minutes stay the same
(Seconds/60)*100 gives you the hundreths value
DM-->DMS
Degrees and Minutes stay the same
(60*(hundreths of a minute WITH A LEADING DECIMAL POINT!)*100 gives you seconds

Some cell operators will let you make calls from a non registered cell phone. Rates are 1.95 a minute and can be collect, credit card, or phone card.

If you have a non registerd phone, try calling a number and listen to the response. In the SF bay area system B will reject you and system A will let you call. The Novaltel phone I have can be set to either system

Newsgroup: rec.radio.scanner
Date: 1998-11-12 00:00:00 UTC
From: Brian Webb <no-spam-bmwebb@tima.com>
Message-ID: <72g63k$aq1$1@topsy.kiva.net>
Source record: 138161

Dan,

The 64 can be modified using the Virtual Downconversion mod to scan/search cell frequencies but not all the frequencies. It's like opening up the 800MHz filter while turning off one of the lower frequency filters and then searching in a lower band. In the 64's case searching between 48-54MHz. The mod involves installing a DPDT switch that manually switches the filters as opposed to software/firmware doing it. That's a very simple way of putting it (because that's about all I know about it) but it does work... better in some scanners than others. With this type of mod, the Pro-64, has a frequency limitation though, it can only scan/search the "A" wireline set of cell frequencies or roughly half, so it's a questionable mod.
Hope that answers some of your questions.

Brian

I am currently trying to decide upon an antenna(s) to mount on my truck for my scanners. I have a BC760XLT and TT Handheld, both of which I use simultaneously. I have tested an 800mHz transciever antenna on a mag base with pretty good success, but since I need to cover from 31.00 up thru the 800 public safety band, it is not the answer (at least alone). Any and all replys will be appreciated.

Drop the 1 in my address to reply

I use 3 of PRO-90 models (same as the 235XLT, different case).
One at home, two at work. These were purchased a few months
ago. None have had any antenna problems (I had heard older ones
had this problem) and the sensitivity is fine. One other problem
that existed in all but the latest of these radios (BC235XLT &
PRO-90) was the radio would fall asleep. Monitor one channel
for a period of time, hit scan and the radio wouldn't receive.
Cycle the radio off/on and all is fine. Must have been a firmware
problem. None of mine suffer from this. I think Uniden got the
bugs worked out finally. They are great radios for the price.

You didn't mention how you wanted to mount the antenna. Magnet mount, trunk lip mount, body mount, window mount, mirror mount or maybe even a bumper mount? Different antennas would work better with different mounts. If you want a good magnet mount just go to RadioShack. The magmount that they have sells for about $30 and works well. There are also several antennas designed to fit the 3/8th inch mounts that other radios like CBs use. I have tried the window mount and wasn't disappointed, but most other antennas do work better.

What about the larger and clearer display on the Pro-91? And the feature
that displays what channel the control frequency and the active talkgroup is
using? Would you prefer to be forced to use a rechargeable battery or would
you like the option of using alkalines as well? I have used both and my
preference is the Pro-91 for the features above.

Rights are rights regardless if it is radio, guns or free speech. One of
the things that make this NG more successful then most is it is more diverse
in its topics with CB radio being a common ground. So support the NRA. If
CB radio had such a lobby we would be in better shape.

>
>Look it up yourself:

I did but there is a better definition within the amerature section that
specifies if the interference is harmonic in nature it is the radio
operators resposibility. If it is determined the interfereance is caused by
front end overload it is basically the device owners problem. Not to say
that some neighborly compromise might be a cure. But there is no pleasing
some people.

What local police agency will be able to determine the nature of the
interferance? Larger cities may have a tech available but small town USA
surely doesn't.

Spend the $30 extra (or less) and get either the PRO-90 or BC235XLT
with twice the number of channels. The BC235XLT comes with two
battery packs and is the same price as the PRO-90. For online reviews
of these 3 radios and more, visit Rich's website at this link:

I've got one and really like it. Does a great job handling our regional trunking frequencies, but around here we only have one major system operating on five channels. I like the fact that it uses AA batteries (alkaline or nicad) and doesn't rely upon a proprietary battery pack. It has a good feel to it and works very well. Most people don't like its limited memory (150 channels), but if that's not a big concern then the Pro-91 is a fine buy at $169.

I tap the discriminator of the PRO2006 at TP2 (test point 2). It looks like
a grey resistor sticking straight up. You can use something like test
jumpers to hook up to it if you don't want to solder to it. Go to this page
to see a picture of it:
http://homepage.dave-world.net/~woody99/html/descrimintr..htm

W> When I'm looking through some frequency databases, there is sometimes an ent
W> after the frequency like (PL 146.2). What does that mean?
W> Appreciation in advance.

It refers to a subaudiable tome transmitted. It is typicaly used to selerate
conversations on "Party Line" typs radio systems so you can seperate
recipeients. The Dispatcher selects what tone is used and only those with
Radios set to that tone hear the transmission.

Anything higher than 60 feet!

Remember, this is a CB discussion:

Federal Communications Commission
Rules and Regulations
http://www.fcc.gov/wtb/rules.html

ï¿½ 95.408 (CB Rule 8) How high may I put my antenna?

(a) Antenna means the radiating system (for transmitting, receiving or
both) and the structure holding it up (tower, pole or mast). It also
means everything else attached to the radiating system and the
structure.

(b) If your antenna is mounted on a hand-held portable unit, none of
the following limitations apply.

(c) If your antenna is installed at a fixed location, it (whether
receiving, transmitting or both) must comply with either one of the
following:
(1) The highest point must not be more than 6.10 meters (20
feet) higher than the highest point of the building or tree
on which it is mounted; or
(2) The highest point must not be more than 18.3 meters (60
feet) above the ground.

(d) If your CB station is located near an airport, and if you antenna
structure is more than 6.1 meters (20 feet) high, you may have to obey
additional restrictions. The highest point of your antenna must not
exceed one meter above the airport elevation for every hundred meters
of distance from the nearest point of the nearest airport runway.
Differences in ground elevation between your antenna and the airport
runway may complicate this formula. If your CB station is near an

airport, you may contact the nearest FCC field office for a worksheet
to help you figure the maximum allowable height of your antenna.
Consult part 17 of the FCCï¿½s Rules for more information.

ï¿½
WARNING: Installation and removal of CB
station antennas near powerlines is dan-gerous.
For your safety, follow the installa-tion
directions included with your antenna.
ï¿½
[48 FR 24894, June 3, 1983, as amended at 48
FR 41416, Sept. 15, 1983]

hope this helps...

Well, I have aircraft and local police calls comming over the cable
interfering with channel(s).

Does that let me take them to court and have their stuff taken?
I think not.

Can I take the cable company to court?
Perhaps when pigs fly, but I will not hold my breath for that.

Gee, it CAN'T be my TV... I PAID too much for it.
I must have over looked that little sticker on the back saying things like
it's my problem.

Gee, can I take the TV company to court?
When I win the lottery.

I have to find SOMEBODY to blame.
Can't say it was my fault,

I didn't see the sticker...

Really...
They can't hold me to that, can they?

Uh-uh, I noticed my scanner interferes with the cordless phone.
Time to take out the trash.

Unsigned; (Scanner police might get me. I missed that sticker too!)

Disclaimer; This was written as a joke. I say this because someone will get
their knickers in a twist and take it seriously, ok?

For parts only, I have a PRO-46 scanner for sale. It does not power up and the antenna jack is missing. Datecode on it is 5A4(Just in case if it can be modded for cellular). Case is in good condition except in the area immediately around the antenna jack where it looks like the previous owner tried to pry the jack out. With my Sony SC1, I have no use for it so I want to get rid of it. Asking $35 plus shipping or best offer.

I think the point here is that IF the radio operator is at fault, due to
running equipment that is not within FCC spec's, then HE should be made
to take corrective measures. HOWEVER, if the radio operator's station is
clean, and there is still a problem, then it is up to the person
receiving the interference to take corrective action. It's only fair.
Why should all radio operators cease operating, when one or 2 faulty
TV's come into the neighborhood?

Ironically, the higher you place your antenna, the less your station
will "get into" TV's and other consumer electronics. This is due to the
fact that the radiation pattern of the antenna is now above the houses
and utility lines that usually couple the RF signals into neighboring
houses.

This is taught at VERY early levels in public school. Here it is.

Convert 41.4563 to DMS (HMS)

1) Take the fractional part of your number & multiply by 60. The
resultant whole number is your minutes:

0.4563*60 = 27.378 (27 minutes)

2) Take the fractioanl part of the minutes & multiply by 60. The
resultant is your seconds.

0.378*60 = 22.68 (seconds)

So, your answer is:

41 degrees, 27 minutes, and 22.68 seconds (41 deg 27' 22.68")

Hi, Dave,

You have to be aware that the TV doesn't have to be "faulty" -- it just
has to be a poor design or simply too close to the RF source. Since
TVs are commodities, you can count on the cheapest design possible that
will sell, and that's not going to be a good design. Part 15 compliance
allows the manufacturers to "get away" with that.

To be fair, how many people -- aside from videophiles -- would buy $2000
TVs because they had decent RF sections?

Can someone advise of some good railroad frequencies to use along the I-15 and I-40 corridors from Bartsow to Las Vegas/Lauglin. Thanks.

Steve

P.S. Is CHP still using the same White frequency for that area. Omly heard Barstow dispatch calling Barstow cars, not Needles or Mojave or Victorville.

actually i read an article...i think on steve's site actually, hang on i have it right here...

yeah http://www.swssec.com/bug2.html

anyway it mentions laser bugging breifly as an impractical method that works intermittently at best in the real world. not only are the voices (& noises) inside the room vibrating the glass but so are all other room noises as well as outside noise too. the signal-to-noise ratio of the modulated carrier must be tremendous and, as steve describes in the article, reclaiming the signal you want from the carrier is iffy at best.

good post though...

oh and before anyone profiles me and gives me away...lets just say i have a vested interest in network security and i like to lurk here to pick up tscm tidbits & the like.

4456. ICOM R-100 review?

Newsgroup: rec.radio.scanner
Date: 1998-11-12 00:00:00 UTC
From: n2rud@my-dejanews.com
Message-ID: <72fk7e$k4u$1@nnrp1.dejanews.com>
Source record: 138323

Greetings,

I would like to hear from those who've owned or used the ICOM R-100 Mobile Receiver. I'll assume it's hot enough on VHF-UHF bands, so I'd really like to hear more about it's performance on mediumwave AM/FM and shortwave. I know the R-100 is not a serious DX machine, but I'm like to have both shortwave and VHF-UHF scanning in the car, and this looks the best unit around. Comments? If you know of any better brand/model for use in a car, speak up. The only other radio in the running is the Becker Mexico, which has no VHF-UHF.

Please send replies by email to: ajninno@syr.edu

Thanks for listening.

Anton

Well, many people here seem to think that, if done right, adding $1 to $10
to the cost of the $200 TV would make it much more immune to TVI from
sources not actually coming in on the received frequency through the
antenna connector. I think this is probably true. I also think it's
very unlikely to happen unless the FCC mandates better TV design.

Ok, Dick:
several years ago, I bought a Motorola TV and had RFI problems
with my ham rig.
Sent them a letter, mentioned FCC, and a week later got a
high-pass filter that took care of the problem.
Maybe they do that so that there WON'T be a regulation!!!

Also Ironically, the higher you place your antenna, the higher the
number of people who can see it and they will of course assume you are
the cause of their problems...whether you are of not.
```

4465. Opinions: What is THE BEST Handheld Scanner?

Newsgroup: rec.radio.scanner
Date: 1998-11-12 00:00:00 UTC
From: talkyal@aol.com
Message-ID: <19981111202715.23063.00000351@ng13.aol.com>
Source record: 138332

I used to have a handheld scanner about 5 yrs ago,
but it got ripped off from my dormitory room.
I haven't bought another scanner in 5 yrs.
A lot has changed since then including "trunking" and
stuff like that, and I haven't kept up with scanning.

But, I miss it (once a scanner always a scanner).
So, I'd like some opinions on what is the best handheld
scanner on the market. Money is no issue. Go for
broke, what is THE BEST handheld scanner on the
market? I always liked Radio Shack and Bearcat,
but tell me what you think.

The government requires TV makers to build TV sets that are NOT
susceptable to interference from legally operated RF devices -
They don't build them that way because it would cost an extra 25
cents a set!!!
If you get interference on your TV, the company MUST provide a
filter for the TV.

Yes, by law, any cell phone inactive or active with service has to be
able to call 911. Instead of some ppl having a minimal service for
emergencies should just keep an old cell phone (bag phone) handy.
Unfortunately this would not work in the situation that you have a
dead battery, you would have to have another way of powering it up.
Some coverage areas you are able to make credit or calling card calls
even though you don't have service.

Well, I resorted to the "reliable source" thing because I wasn't sure that the person who told me this wanted it known. However, I have since learned that I can now open my kimono (those of you with weak stomachs should now avert your eyes). My source was one of the techs at Bandercom.

I have already claimed the first spot in the line to get one. I'll buy it, sight unseen at any price. There is no better scanner than a Yupi!

>So, I'd like some opinions on what is the best handheld
>scanner on the market.

Best is relative, like everything else. If you want a scanner for trunk tracking, that rules out most except the BC235 or its Radio Shack counterpart. If you want a handheld with computer control, then you might consider the AOR8000 or AOR8200. If best means having the smallest, then you might consider the Icom R2, But if you mean best all around, then it would be the Yupi MVT7000 or MVT9000. Of course, that's the biased opinion of a devoted Yupi fan.

4481. Question- (What is PL?)

Newsgroup: rec.radio.scanner
Date: 1998-11-12 00:00:00 UTC
From: wiseguy876@aol.com

Source record: 138348

When I'm looking through some frequency databases, there is sometimes an entry after the frequency like (PL 146.2). What does that mean?
Appreciation in advance.

Chris

Better check again, Art. Word I got was that congress did indeed give the FCC the authority to require the manufacturers to build consumer devices that wouldn't be susceptable to RFI, but that FCC declined to put that authority into regulations. So there is NO such requirement,

Source record: 138354

Hello

One more log for for the always busy and easy to listen North
Atlantic Airspace. Freqs used were 4675, 5598, 6622 and 6628 KHz.
Some new aircrafts for me including a Transcolombian operating a
Cargolux Boeing 747. It was corrsing Santa Maria Airspace.

The Radar View of the complete North Atlantic airspace at the time
the log was made is available at:

http://www.geocities.com/SiliconValley/Lakes/9420/shotex17.gif

Also let me invite you to check PopComm's December issue: it
contains a detailed 2 page article about AirNav, the program I used to do
this airspace view.
Hope you enjoyed the post.

Best regards, Andre Brandao

A "PL" tone is a Motorola trademark, called CTCSS as that standard name.

It is between 67 Hz & 250 Hz & is continously sent on the transmitting signal to activate a receiver. A signal without the tone will not activate the received but will still be on the Radio frequency. You usually will not hear the CTCSS tone, or if you do it will sound very low.

I'm looking to buy any old Bearcat ThinScan radios. Preferably working. It's a strange radio
interest I know, but what the heck.

Drop the asterisk at the end of my e-mail address when responding.

Paul

Interesting. I knew that but never really thought about carrying a non
serviced phone.
Is it really appropriate to call 911 for AAA? Maybe you could just
summon police for a road emergency if it happens to be a patrolled
roadway.

TEST MESSAGE

4505. RIPOFF WARNING RIPOFF WARNING TOM KASEY from KY

Newsgroup: rec.radio.scanner
Date: 1998-11-12 00:00:00 UTC
From: webmedics@aol.com
Message-ID: <19981112021453.25687.00000504@ng33.aol.com>
Source record: 138372

That number posted of 502.625.9959 rings a bell..... That's the number he originally listed for his Business Trunkcomm. Trunkcomm's business address is 5703 Bluegrass parkway

Although I've let a detective john Herbst from the St. matthews Police department know all this information. they have been unable to stop this guy. Det. Herbst's office is 502.899.2535

Some additional info on T. Kasey Thomas E Kasey aka E. Thomas aka Chuck Ezell aka Thomas Elwin beware of an S. Hanks as well
trunkcomm, trunkman, ethomas91and maybe as many as four more from hotmail, excite and AOL including HAM callsigns one of them being WB4UMR
DOB 2-11-71
SSN 404.27.6044
His KY Drivers Lic lists
7017 Billie Lane in Louisville as his last know address.
This is the one he gave prior to his arrest and bail a couple of weeks ago.

He has taken most of us at 8108 Lake Terrace suite 10 in Louisville
His landlord is Westbury apartments at 502.426.4817. they may have a forwarding address, as well as the post office, since he's still got funds comming to the Lake terrace address.

Some additional contact numbers worth exploring are:
502.426.8662 (note 502.426.8661 is listed in some of his E-mails)
502.426.8511
502.267.7224

I have reason to believe that he and his girlfriend Ms S. Hanks (aka SKANK hahahaha) are involved with a multilevel fraud with a local fundraising organization. This is called Entertainment Fundraising 1257 Herstborn Parkway in Jeffersonown.

Also, money Now KY Inc. is doing his money laundering Money Now deposits it's funds into the PNC bank. The Money Now office on Hikes in Louisville has knowingly cashed these fraudulently obtained money orders. Thier number is 502.456.6663. Spoke with a jerk-off named Scott....he threatened to SUE ME..... and told me to contact his manager, Mark Atterbury @ 502.364.1634. He doesn't return my calls. They have another office on taylor Blvd, 502.375.2274, ask for Tammy

Would someone please get this guy!!!!!!!

I hope any of this information will prove useful in his demise.

Diaper_Reagan <CHECK_MY_SIGNATURE@EMAIL.COM> wrote:
>Everyone one of you who posted a denial of what I stated can go to hell.

Diaper - let's place this in a more understandable setting which should be easier to understand: Suppose your neighbor is an amateur entomologist and collects and breeds insects. Knowing this, suppose you open all the doors and windows of your home and remove all the screens. Whom should you blame if your home then becomes infested with flies and other insects, along with some stray dogs, cats and kids? Are you going to accuse your neighbor of shooing flies into your home?

Now apply the above analogy to your television interference: Your TV has numerous "open doors and windows" due to cost-cutting engineering. This makes it susceptible to "flies and other insects" from your neighbor's collection. All you need to do is to place screens on all those "open doors and windows" in your TV (by shielding and filtering), and allow your neighbor to continue his lawful hobby in peace.

(OTOH, if your neighbor is raising a squad of trained killer bees which attack you in your yard, THEN you have every right to demand he correct his unlawful actions.)

Do you understand now?

Though you do not mention the type of scanner,
I think I can answer your question.

Two types of civil aircraft communication exist,
one being aircraft-to-ground, usually for navigation
purposes, the other being aircraft-to-homebase,
usually for crew-to-company communication.

Aircraft-to-ground communication takes place
in the frequency range 108-118 Mhz for automated
transmissions, and in the range 118-136 Mhz for
voice communication.This type of communication
is only possible between aircraft and ground
stations that are 'visible' from the aircraft.

All communication in these bands however is AM
transmission, as opposed to narrow FM for any
other band as implemented on most Uniden /
Bearcat scanners (some do support wide FM for
UHF TV broadcast bands).

Since your old scanner probably has ho circuitry
to extract audio from AM, but only from FM, you
will not be able to upgrade your scanner to
receive aircraft-to-ground communication.

Aircraft-to-homebase communication is primarily
used to contact the homebase even if the aircraft
is 'at the other end of the world'. This type of
communications is performed at company
dependent short-wave frequencies, and often are
so called single side band (SSB) transmissions,
a type of transmission without a carrier, and using
an even smaller piece of radio spectrum than AM.

Again, since Uniden / Bearcat scanners are not
equipped with SSB circuitry (so called beat
frequency oscillators or carrier re-insertion logic)
you will not be able to upgrade your scanner for
this type of transmissions.

Apart from this, hardly any Uniden / Bearcat
covers frequencies in the short-wave area
(1.6 to 30 Mhz) nor the VHF-Air (108-136 Mhz)
though this might be circumvented by a frequency
converter.

Hope you are satisfied with this non-so-satisfying
answer to your question.

BTW, there are excellent dedicated aircraft-to-
ground scanners available from Yupiteru, and
most scanners sold to date also are VHF-Air
capable (but the dedicated Yupiterus's definitely
outperform each of them, including real heavy
base scanners).

Brgds, Fabrizio

> problem.

However, the exact same can be said for the owner of the TV. So what do you think, is one legal operator responsible for solved the problems of another?

> I'm also aware that some TV's and steros are so cheaply made
> they pickup the dog barking across the street.

Yep, so now what. You expect the ham to solve the problem caused by YOUR poorly designed equipement?

> It's the CB Rambo who
> sets up junk in the middle of a neighborhood trying to put out 10,000
> watts that makes it hard for all of us. I run a 2950 through a 350 HD
> into a antron 99 (a bleeder so some say) and I have no problems because
> i simply took the time to set my rig up before I keyed the mic for the
> firat time.

However, that is only to say that YOU haven't had any problems, and you are not aware of any problems. Which does NOT mean that problems do not exist because of YOUR transmissions. What if someone with a $25 13" TV convinced the town to ban your operations because you caused interference to his cracker box TV, or demanded that you install hundreds of dollars of equipement to keep him from having to buy a $5 high pass filter or spend another $20 on good quality coax instead of the swap market special he's using now. Sorry, but limits have to be drawn. If the transmission is legal, and you still have TVI then it is up to YOU to fix the problem with your TV.

Sorry, while you should temporarily suspend operation until you confirm that you are within the legal limits, once that is confirmed any continueing interference is not the responsibility of the ham. He will almost certain work with you to solve it, but that's from public spirit, not the law.

Further you do NOT need to prove that you aren't causing the problem, but rather (like any other law violation) it's up to them to prove that you are.

No. The FCC doesn't let manufacturers sell transmitters or other
devices that generate more than some specified amount of unwanted
RF on any frequency. The manufacturer has to limit unwanted RF output
or he can't sell the device. Violators face fines.

If my radio rig improperly picks up the local TV station properly
transmitting on their assigned frequency and power level when I'm trying
to listen to a ham radio frequency, should I be able to tell them to
stop transmitting? I also like to listen to various police, railroad,
etc. frequencies, but a cheap (or sometimes expensive) scanner will
also pick up nearby, legally operated pager services on other
frequencies. Can I tell them to stop transmitting, too?

Yup, that sort exists... However, it isn't necessary to be doing something
illegal to cause interference. I've no idea why I got into this argument;
there's just no end to it.

From: bravoorig@my-dejanews.com
Message-ID: <72de6jofi1@nnrp1.dejanews.com>
Source record: 138426

I'm new to police scanners and such, and I purchased a RadioShack PRO-91 mobile scanner, in the scanner. It works great for me and I have no probs. Does anyone have any suggestions on modifications internally or externally to pick up more freqs and such. Maybe cell phones? I know, I know, its illegal, but who can resist. It comes with a run of the mill antenna, are there better mobile antennas out there I should replace it with? Also looking for suggestions on a base antenna to use when at home. Actual users of the scanner, reponses from them are prefered. You can tell me to cut a resistor here or a cap there, I know my way around electronically, so if there are any modifications to be done there, tell me about them. Please email me instead of replying to the newsgroup as it'll be hard to find my post. I'm using Dejanews since my newsgroup reader is messed up, so email pls. Thanks, Mark

>was OK to record Monica, now they are back to it is
>terrible to record Newt.

A fair point ... but only fair. Recording Monica was
gathering evidence of a crime already known to exist,
while recording Newt - by unknown, uninvolved persons -
was simply voyeurism (and, given his position, a
potential national security breech). Hmm ... if ABCs
sources recorded one word about Iraq while they were
listening for juicy stuff, they are probably in
violation of all sorts of espionage laws.

The president is supposed to keep the congress informed
of potential use of military force - and Newt would have
been the primary contact for that purpose. This is info
which Saddam Hussein and many other potentially unfriendly
entities could profit greatly from.

So - ABCs boys are SPIES in my book. Arrest the traitors !
Where's the goddamn FBI when we need them ? Cruising naughty
web sites and persecuting gun store owners probably.

Monica, well, she didn't know much about such things
beyond what BC said on the phone while she was sucking
his knob. Still a potential security problem though.
Arrest Tripp for recording - and if Monica repeated
anything about Iraq or Bosnia to Tripp, arrest her too.

Heck, I had one case of a lady whos problem was tracked to the transformer
hanging on the pole outside her house.

Now tell me that TV's aren't poorly shielded.

wrote:

>This is simply not true. Some sets will generate mucho harmonics and can
>cause interference in TV's and phones with as little as one or two watts...
While possible, there are other explanations that are much more
likely. Even harmonics are rarely a problem. The standard 1/4 wave
antenna has an infinite impedance to even harmonics. It is very hard
to couple much energy to the antenna on even harmonics. To be type
accepted, you need to be about 30db down on the 3rd harmonic (which
puts the output on the 3rd harmonic at literally milliwatts). TV
signals are HUGE, at best the few milliwatts could cause trouble at
51Mhz within perhaps 100 meters, max... A low pass filter on the
antenna feed can reduce the harmonics to something on the order of
50db down, which puts the harmonic output in the microwatts range.
It's hard to cause much interference at those power levels.

The more common problem is inadequate shielding of the TV cabinet. The
27Mhz AM signal from the CB is so strong at close range that it either
is received by the inadequately shielded circuits in the TV, or comes
right through the front end of the TV because the TV lacks adequate
bandpass filtering on the front end.. In the latter case, a high pass
filter on the feed to the TV will cure the problem.

Telephone get clobbered because of unshielded cables near the antenna.
Devices in the telephone may act as envelope detectors. At close range
the induced voltages in the telephone lines are the same order of
magnitude as the signal/ With a telephone it is usually a raw signal
power problem, it has nothing to do with harmonics or spurious
radiations.

Evening Chris. PL, stands for Private Line, a Motorola name for
CTCSS, which is also known by such names as Quiet call, Tone Squelch,
and others.

It is used to allow radios to have a method for sharing frequencies,
such as in community repeaters, for users not to hear skip and other
things, and a scad of other uses.
Normally 67 to around 250 Hz, transmitted all the time a user keys the
microphone, on systems equipped with it. There are standard tones,
but there are also non-standard tones in use.

They are called sub-audible, but they can be heard, albeit not very
loud.

Especially when you consider the manufacturers of TVs leave out about $3
worth of parts that would keep the unit from picking up things it's not
supposed to be picking up.

$3/unit * 10M units = real money

I don't think the folks at Yupiteru would think much of this post. The
top of the line product is the MVT-9000. Its performance measured as
sensitivity is marginally less than the MVT-7100, featurewise however
there is no comparison. The MVT-9000 leaves the 7100 in the dust..
>
>It has full, continous coverage from 530khz to 1650MHz. Any mode from AM,

>tuning of SSB stations such as transatlantic aircraft
Selectivity on the 7100 is so poor that the 50hz tuning increment
feature is nearly useless. MVT9000 offers a 4Khz Narrow AM mode that
works a lot better on HF than the standard 12-15Khz..

Radio is "cell" enabled. It is in only fair condition - the backlight is on it's last legs, i.e., not very bright. Also, there is a indentation on the top of the plastic cabinet where a small 7-watt night light bulb melted the plastic. It's not all the way through, not even close, but, it's pretty obvious. I have the box and the manual.

Prefer local (San Francisco Bay Area, I'm in Mountain View) buyer that can come pick it up (and pay cash).

I'll take the highest offer over $150 after 5 days.

Body handling: Binary attachment payload not displayed: vcard.vcf

I just purchased a BC760XLT scanner used. The scanner itself works great. This is any early version, the one with a Motorola plag for the antenna and AA batteries for the memory back-up. My question is, when the CTCSS tone board is installed the scanner wants all channels to have a tone programmed. It seems to me I heard of a way to program this scanner to work without a tone even with the tone board turned on.

One more question ... when I program a frequency with a tone of 131.8 it doesn't seem to decode the tone. All other tones seem to work fine. I tried to put 453.050 with 131.8 for the tone and it never opened the speaker even though there was traffic on that channel with that tone. Any sugguestions???

Thanks in advance for your help. Any and all sugguestions welcomed.

Mike Derryberry

Hi! I have Radio Shack Pro-43 scanner for sale. It is one of the later models which is not cell restorable. No mods, a cosmetic 9, and perfectly functional. Includes a ducks, and AC adapter/charger.

Some specs:

200 channels (10 banks/20)
10 channel monitor bank (for quickly storing searched freqs.)

Covers:
30-54 MHz
118-174 MHz
220-512 MHz
806-1000 MHz (cell blocked)
AM/FM

$150 shipped to your door. No trades, please.

Please drop me a note if interested.

Cheers,

Paul WD8DKY

Mac,
I had a Pro-2004 from Shack a couple of years ago. I clipped the diode for continuous coverage, and some months later the same symptoms happened to mine. I took it back to Shack for repair, but came back still doing the same thing. After 3 repair tries, they finally had to give me a new one. After 3 months of use, the new one's screen just went blank. Plain green with nothing. I gave up at that point because I was too fed up to go through the repair BS again. I never did resolve the issue, but I am sure there are many dead Pro-2004's out there.

In my area, EDACS is the prominent protocol. Annoying
tones and buzzsaw sound. If ETRUNKER software is used,
with a computer controlled scanner, I can follow an EDACS
system. The Motorola system isn't the ONLY system this
setup can follow, unlike the PRO-90. I like my PRO-90
also but it has limited use here. Like he said, this may not
be for everyone, but if you are in an EDACS area, you'll
want it!

Bill,

Thanks for your reply. I also have done the same mod's, as I am sure many have, and I suspect that might have had something to do with it... Keyboard seems to be passing info to the CPU fine, but it seem like the CPU may have toasted itself. It is weird, because on the second unit, the issue is the same, but much less severe, some frequencies it will accept fine, others it will be off by a slight amount (i.e. 155.535 would show up as 155.5364 or similar) many times close enough to monitor the intended frequency, but seemingly headed in the same direction as the second unit.

Too bad the CPU really is an ASIC, so it is far from generic CPU, or I would just put a new one in. I am going to take a good hard look at this, and might end up buying a new CPU if it isn't too expensive, otherwise this might be a project radio where I try to replace the CPU with a protoboard/Logic Analyzer Pattern Generator Pods combination and try to make it a Computer Based scanner...

I am very curious to find out if other people have had this issue. If you have experienced similar, could you toss up a post here? Anyone with a Pro-2004 that has been dropped or similar failure mode, and might sell for a good price, let me know!

My Thanks in advance for your time everyone!

4565. Police Frequencies 483.0-485.0? BC235xlt SVC Scan

Newsgroup: rec.radio.scanner
Date: 1998-11-13 00:00:00 UTC
From: Taylor Hively <taylor@NOSPAMislandparadise.com>
Message-ID: <364CC5BA.8CB7EFB0@NOSPAMislandparadise.com>
Source record: 138213

I have a Uniden Bearcat Trunktracker (BC235xlt) and it has this lovely feature called a "service" scan
For those unfamiliar with this feature, it scans "Fire/Emergencey", "Police", "Marine", "Weather", or "Air" frequencies. Well it "searches" these groups of frequencies.

When I run this svc scan, I pick up what sounds like radios used by businesses and perhaps taxis.
Frequencies in particular are 483.8624 - 484.8875

All of the police/sherrif activity in this are in the 400 range is from 460.000 - 489.0000

Now, this leads me to believe one of 3 things:
1) These business frequencies are in a freq. range that is intermixed with the police freqs.
2) Uniden just searches a block of 400 range frequencies (everything between 2 frequencies) and doesn't bother to lock out the business frequencies.
3) Uniden made a mistake.

Does anyone know exactly what frequencies and ranges of frequencies the "Service" scan feature scans? I haven't found anything that tells. What frequencies does Uniden think are police.

Anything else to enlighten me on this?

Thanks,
Taylor Hively

I have a 2004 with a "flaky" problem too. Mine scans fine, and then for no apparent reason, goes berserk!! I turn it off for a minute or so and the back on, and everything is OK! (until it the next time) ?? I was told these radios have a history of "cold" solder joints. I haven't had I chance to get mine checked yet!

Thanx!

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.scanner,rec.radio.swap

I have a very clean TE Systems 0550 G amplifier. The amplifier does about 360 Watts with 10 watts in. The amplifier is in great working condition. The unit uses 4 (MRF492) transistors. A couple of months ago I blew up one of the four transistors due to antenna problems. I replaced the right side symmetrical pair with a new matched pair. The amplifier is back to normal and has been used for a couple of months with no problem. I will supply the unit with a match pair of new MRF492 as spares. The amplifier sales new for $484. I will ship it anywhere in the US with the spare transistors(2) for:

$375

Why don't you people grow up, you sound like a bunch of cb'ers on channel 19. One flame after another. The person "KA0SSP" above all should know better. And I will check it out on the web.

Have you no interest in scanning - then take that bull crap elsewhere. Digging through all the bull crap to obtain an interesting thread becomes tiresome.

Cross-posted to: alt.dbs.echostar,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.space,rec.radio.scanner,rec.radio.swap,sci.electronics.components

I have a box of new KU Band LNB's. Input frequency is 11.7 to 12.2 GHz and output is 950-1450. Units are new in the box. The units are conservatively rated at 1.2dB NF. These are high quality units with guaranteed Noise figure performance. Most LNB's out there are rated at .7 dB, but really have 1.0++ NF. These units use a DRO module at 10.75 GHz. The module can be easily removed. I have soldered an SMA cable where the module was located to insert a different LO. With minor tuning I got them to receive great at 10 GHz.

I will sell them for $30 each or 5 for $105 including shipping. These LNB's produce perfect P5 pictures on most birds with a simple 3 foot dish antenna.

Good Evening;

May I suggest that when you say that "an ordinance from Wisconsin that has passed review by the courts." you must advise "which" courts have passed review? I assume that the statute was tested in the superior level of a county court in Wisconsin and the court found for the defendant, namely the city or county. However, you have not stated whether or not the appellate process has been completed.

This situation sounds to me, even though a rider from Senator Feinstein has passed the senate and presumably been signed into law by the president, quite unconstitutional in that the FCC has preemption in this matter. There is a conflict of interest in a duly authorized federal entity, the FCC, having its duties usurped by a local administration under the guise of federal protection to administer the federal law as set forth by said federal entity, no matter what the legislative system gives it permission to do.

Imagine, if you will, the Los Angeles Police Department being given permission to execute INS policies and procedures with reference to illegal aliens, by an act of Congress. The LAPD wouldn't do it for fear of civil litigation brought by defendants. The same thing will probably occur in your city. The proper way to defend against this situation is to not go to meetings and decry the new statute proposed by the city but to merely suggest to the city fathers that should any act of local law enforcement cause a loss to any citizen in that community by said act, there would start a groundswell of lawsuits against the city under numerous grounds by said defendants.

I do not believe that a small city would want to NOT consider this issue in that light.

Sincerely,

Paul, K6PY

Mostly point-to-point relays. Part of the PCS band. Perhaps satellite transmissions. Not much that you could monitor with a radio scanner. Some of the newer cordless phones use this band.

Pulling the battery pack will prevent cell reversal which is
caused by multiple cell packs discharging past 0 through
a load, but it will NOT prevent the actual discharge. NiCads
have an internal resistance that will cause the cell to discharge
on the shelf. I seem to recall the rate is approximately 1% per
some hours, like half a day or something.

But places like EveryThingWireless sell generic packs for Cell
phones that take standard Alkaline batteries. And I seem to
recall a small stand that allows some phones to operate
without a battery even attached.

You an demand that the cable company provide
a cable feed that is free of interfering signals. Now
that assumes the interfering signal is actually in
the cable signal entering your house AS OPPOSED TO
the cable signal being clean and your inside wiring or your
TV being suseptical to the interfering source.

Cheers,

Well, it's a Uniden, and I love my BC235XLT (Radio Shack's Pro-90)!
However, CEI (http://www.usascan.com) sells the BC235XLT for $169.95
plus $18 S/H.

AFAIK, the 235XLT (Pro-90) and the Pro-91 are about the same except
for the extra 150 channels you get with the 235 :)

4595. LTR Scanners?

Newsgroup: rec.radio.scanner
Date: 1998-11-13 00:00:00 UTC
From: wilrobnson@aol.com
Message-ID: <19981112223958.27737.00000749@ng122.aol.com>
Source record: 138244

Since all the hype lately regarding rumors and "facts" about digital trunktrackers and EDACS trackers, I have been left wondering, is anyone working on an LTR capable scanner? Uniden already has the technology as evidenced by their site where you can get the specs for their LTR radios. I don't know what the market would be for one of these. I know I WOULD want one, as the entire Washington State DOT is on an LTR system, and the state emergency readiness plan calls for state agencies to make use of it, even specifies the channel for statewide calling (System2, Group2). Just typing with my fingers crossed!

What kind of equipment is necessary in order to triangulate a radio signal? I want to be able to figure approx distance and direction of a radio signal <variable frequencys>. It would be nice to have it hook into my laptop (currently a Macintosh pb 1400 / 166) but info on a stand alone unit would also be helpful. Thanks in advance.

Get the service manual for yer scanner and remove the
bypass cap from the input of the audio chip.

Works wonders for the Pro-Series scanners and Unidens.

BTW, thanx to Bob Parnass for this one from WAY back when.....

```
Tracking Trunked Radio Systems Without
a 'real' TrunkTracker Scanner
================================================

Revised: November 12, 1998

This article is copyrighted (c) 1998 by Bill Cheek
and all rights are reserved. It may be freely
disseminated, stored, and transferred, and placed
on Web sites, so long as the entire article remains
intact, unedited, and unaltered.

================================================

Yes, TrunkFollowing is now possible with the
legendary PRO-2004/5/6 scanners, and perhaps with
other scanners in due time!

YES! You can now track the trunks without a "real"
TrunkTracker scanner! I call it "TrunkFollowing"
to avoid any conflict with Uniden's use of the
terms, "TrunkTracker", "TrunkTracking", etc, but
the results are the same or better.....I think MUCH
better....

Don't get me wrong here - TrunkTrackers are a great
idea; maybe the greatest idea since cellular mods
and anchovies on pizza. My problem is that Uniden
seems to have a lock on TruckTracker scanners so
far. Even Radio Shack's TrunkTrackers are made by
Uniden. Whatever happened to "competition"?

Anyway, I just don't like Uniden scanners. They
remind me of Muntz TV's back in the early 60's.
If you don't know about those, you're better off.

It annoys me to have to buy a glitzy radio with
exhaust pipes, louvre flames, mud flaps, drag slicks
and racing stripes just for a snazzy firmware
feature. So I don't do 'real' TrunkTracker radios.

However, it's my pleasure to report on tracking the
trunks with the PRO-2004, PRO-2005, and PRO-2006
scanners, and it is probable that a number of other
scanners can be included as techniques and processes
are developed and refined.
```

Yes! It is now possible to track the trunks
without a TrunkTracker radio. Call it an
alternative method if you will, but I think it
beats the real TrunkTrackers!

Why is it better?

Well, the PRO-2004/5/6 scanners are easily the best
scanners ever brought to market, in terms of what
counts up front: performance, features, and
modifiability for better performance and more
features.

So it makes sense that if these scanners can be
made to track the trunks equal to or better than
the official TrunkTrackers, then they will be a
better value than the TrunkTrackers.

I will hasten to add that this method may not be
for everyone. One shortcoming is that you can't
track the trunks while you hoof it around via the
tennis-shoe express, like with a hand-held PRO-90
or BC-235XLT. But so long as your interests are in
automated TrunkFollowing from a base station (or a
mobile), then what I've got to show you is unparalleled!

So How Do You Do It?

I said it wasn't for everyone. There may be a
modest cost, if you have only the basic hardware.
I'll leave it to you to add it all up, but for many
hobbyists, it won't break the budget.

Then it takes a little work and a bit of understanding
of the process. In other words, I can't hand you a
free black box that plugs into the headphone jack
of the scanner for happy TrunkFollowing into the
here-ever-after. Of course, the 'real' TrunkTrackers
aren't free or 'no-brainers' either.....

But I can turn you on to the products and processes
that will turn your PRO-2004/5/6 into the slickest
TrunkFollower yet.

Following is a list of what you need, together with
an overview of the necessary connections and hookups:

==========
Minimum Requirements For TrunkFollowing With
the PRO-2004, PRO-2005, and PRO-2006
==========

Hardware Requirements

+ HB-232 or CE-232 Interface; available from:
(See signature box at end of this article)

+ PRO-2004, PRO-2005, PRO-2006 scanner with the
HB/CE-232 installed and working.

+ A second 800 MHz scanner of any type that has the
"NFM Discriminator Mod" with the baseband audio
signal tapped out to a jack on the scanner.

+ The "HamCom DataSlicer" or my "Decoder Interface"
circuit that plugs into the baseband audio jack
on the 2nd scanner mentioned above.

For more information on making a Decoder Interface,
see the World Scanner Report, V8N4 and V8N9 or
see my SCANDATA.FAQ, available at my FTP site.

AND, either

+ One modern high-speed PC, Pentium 133/up, (slower
Pentiums might work, but we don't know for sure
yet) running under Windows 95/98 with 3 open
COMports and a different IRQ assigned to each
port. This can be COM1/IRQ4, COM2/IRQ3, and
COM3/IRQ5, for example. You will need to wire a
serial plug to fit COM3 on the PC; a female DB9
or DB25. Just 2 wires come off this plug (ground
& RxD) and go to the ground and TxD pins in the
Data Decoder /Slicer Interface.

OR

+ Two PC's, one a 486DX2/66 or better, running
under Windows 95/98/NT4A with two free COMports
and two free IRQs, say COM1/IRQ4 and COM2/IRQ3,
AND: a 2nd PC, 386 or better, running MS-DOS
6.0/up or Win95/98, with two free COMports, AND
a null-modem cable (or straight-thru serial
cable and a null-modem adapter) to connect
between one of the COMports on each PC.

Software Requirements
=====================

+ Pro-Turbo v3.45.33/up, for the HB/CE-232,
available from: Paul E. Turton;
RR # 3; Wainfleet, Ontario Canada L0S 1V0

E-mail: pturton@iaw.on.ca
Web: http://www.iaw.on.ca/~jabba/pro-turbo.htm

+ TRUNKER v3.7(beta) or later (freeware!) available
for download from either of these two web sites:

http://web2.airmail.net/lblant1/dfw/digital.htm
www.geocities.com/CapeCanaveral/Lab/1060/beta.htm

AND / OR

+ ETRUNK v3.7(beta) or later (freeware!) available
for download from either of these two web sites:

http://web2.airmail.net/lblant1/dfw/digital.htm
www.geocities.com/CapeCanaveral/Lab/1060/beta.htm

Typical Configurations for great TrunkFollowing
==========

Using one computer under Win95/98
==========

+ HB/CE-232 Interface connected to COM1

+ PRO-2004/5/6 connected to HB/CE-232

+ Data Decoder/Slicer plugged into COM2

+ 2nd scanner tuned to a trunk data signal, feeding
the Data Slicer/Decoder.

+ Ground & TxD pins of Data Slicer/Decoder patched
out to the RxD and Gnd pins of a DB9/DB25 plug
in COM3

+ Pro-Turbo running the HB/CE-232 in a window

+ TRUNKER.EXE or ETRUNK.EXE running in a second window.

Using two computers
==========

+ HB/CE-232 Interface to COM1 on PC1

+ PRO-2004/5/6 connected to HB/CE-232

+ Data Decoder/Slicer Interface to COM1 on PC2 Data
Slicer/Decoder.

+ Null-modem cable (or serial cable and a
null-modem adapter) connected to COM2 on PC1 and
to COM2 on PC2

NOTE: Optionally connect a straight-thru serial
cable to COM2 on one PC over to a null-modem
adapter on COM2 of the other PC. This is the same
thing as a "null modem cable". Radio Shack's
#26-264 or #26-1496 are null-modem adapters.

NOTE: Pre-made RS cables are costly! Make a
low-cost serial or null-modem cable with a female
DB9 (or DB25 as needed) plug on each end of a

shielded 9-wire cable. Electronic stores carry
the cable; Radio Shack has the plugs and
adapters.

+ PRO-TURBO running the HB/CE-232 under Win95/98
on PC1

+ TRUNKER or ETRUNK running under Win95/98 or MS-DOS
on PC2.

Operation
=========

TrunkFollowing operations are managed by Pro-Turbo
and controlled by the freeware programs,
TRUNKER.EXE or ETRUNK.EXE. Therefore, you should
refer to the documentation for Pro-Turbo and
TRUNKER or ETRUNK to polish off the rough edges
left by this introductory document. But, here's a
wrap up and overview of what it takes to run a
TrunkFollowing operation.

REVIEW AND SUMMARY
==================

TrunkFollowing with the PRO-2004/5/6, the CE-232,
and Pro-Turbo represents a milestone in the
transfer of high technology to the casual hobbyist.
I haven't had as much pure satisfaction from a
hacking and mod'ing effort since about 1988 when I
boosted my PRO-2004 from 400-channels to 6400.

What a thrill that one was, and this one is every
bit the equal or better. But like I said in the
opening lines, it's not for everyone. I can't
decide for you, though, so following summarizes
what you need to track the trunks with your
PRO-2004/5/6 and maybe later, other scanners:

PREPARATION
===========

1. Prepare an APF file for the HB/CE-232 that has
just the trunk freqs of a single system. It must
have channel numbers. Here is an example for the
San Diego city's trunk:

, 41,856.0250,nfm,d,,, , 50,859.0250,nfm,d,,
, 42,856.0500,nfm,d,,, , 51,859.0500,nfm,d,,
, 43,857.0000,nfm,d,,, , 52,860.0000,nfm,d,,
, 44,857.0250,nfm,d,,, , 53,860.0250,nfm,d,,
, 45,857.0500,nfm,d,,, , 54,860.0500,nfm,d,,
, 46,858.0000,nfm,d,,, , 55,862.0500,nfm,d,,

```
, 47,858.0250,nfm,d,,, , 56,862.1000,nfm,d,,
, 48,858.0500,nfm,d,,, , 57,863.0500,nfm,d,,
, 49,859.0000,nfm,d,,, , 58,864.0500,nfm,d,,
, 50,859.0250,nfm,d,,, , 59,866.5625,nfm,d,,
```

As you can see, the channels start at 41 and end at 59. Channels 60-80 are zeroed and locked out. Delay isn't important.

2. Program other banks of the PRO-2004/5/6 with any frequencies you like.

3. Program just the data channels of the trunked system into a bank of the 2nd scanner, and fill the rest of the channels of that bank with locked-out zeroes. SCAN this bank and the scanner will stop on an active data channel.

4. Prepare a DOS batch file to run the Trunker (or ETrunk) program. The docs are clear about it, but here's mine:

```
set TRACKSLICERPORT=COM2
set TRACKSLICERPIN=CTS
set TRACKSLICERMODE=INVERT
rem set TRACKSLICERMODE=NORMAL
set TRACKSCANPORT=COM2
set TRACKSCAN=AR8000
set TRACKSCANPARK=800.0000
trunker.exe
```

Create this batch file with a text editor such as NOTEPAD or WORDPAD and save it with a filename like: TRUNKTR.BAT in the Pro-Turbo directory. Create a shortcut to this batch file and place it on your DeskTop for quick and easy access.

NOTES: Pro-Turbo acts like an AR-8000 scanner as far as Trunker is concerned. That's the TRACKSCAN setting. Note the 'remark' line for TRACKSLICERMODE=NORMAL. Most trunked data control signals need to be INVERTed for Trunker to decode them, but some may need the NORMAL setting. The above makes it easy to 'rem' out one and 'unrem' the other, quick and dirty.

5. Read and become familiar with the docs on Trunker, ETrunk, and Pro-Turbo.

OPERATION
=========

1. Load Pro-Turbo and ensure that it comes up okay
and operates normally. Run the APF function to
load in the trunked system prepared above.
AutoProgram any other channels you want at this
time.

2. Load Trunker or ETrunk and ensure that it comes
up and operates normally. Make sure your Data
Decoder/Slicer works fine with Trunker before
trying to TrunkFollow. The two will run
separately, if you want.

3. Run the TrunkTrack feature of Pro-Turbo and
follow its instructions for testing the setup,
and then run it!

4. Read the Trunker docs for the in's & out's of
running a TrunkFollowing operation.

That's it: Hands-off TrunkFollowing! Most operation
is from the Trunker window and it's mostly hands-off
with Pro-Turbo and the CE-232. And, it's all easier
done than talked about.

Most of the above connections and preparations are
a one-time effort, leaving you to enjoy the automation
of tracking the trunks. Oh, and you have a lot more
control over and understanding of the entire process
of trunk-tracking than you do with a "real"
TrunkTracker scanner - a lot more!

I'll be the first to say that tracking the trunks
with Pro-Turbo, a CE-232, and a PRO-2004/5/6
scanner is anything but "state of the art" yet.
After all, this is the first public announcement of
the dynamic trio, but I think it is ready for prime
time, and that the first wave of users will help us
refine the instructions and efforts that it
initially takes to get up and tracking. By golly,
it works!

The Fine Print
==============

I had some trouble initially getting my Trunk-
Following operation up and running. Most of the
trouble was my overloaded computer and a lack of
free IRQs and COMports. I solved the problem by
moving the sound card IRQ from 5 to 10 and by swapping
video cards with one that didn't use an IRQ.

I doubt many of you guys will run into the kinds
of problems as I did. I'm weird, and pack everything
possible into my PC's. I could have easily set up

TrunkFollowing on any of my other PC's, but I wanted it on my main workstation so I could run the darned thing and write about it at the same time. You won't run into this type of issue, most likely.

Your problems are more likely to be with the system as a whole and with the Trunker and ETrunk programs. System-wise, I can tell you to avoid slick tricks and underpowered machines. Trunker and ETrunk work fine on MS-DOS machines, but they are very demanding of CPU resources, and so don't count on blazing performance when you run them under Win95/98, especially on the slower Pentiums.

Trunker and ETrunk will run fine alone in a DOS window of Win95/98 on a 486DX2/66, but you really can't expect to run much more at the same time on that old and slow of a machine. Pro-Turbo runs fine on a 486DX2/66, too. But combine it with Trunker or ETrunk at the same time to track the trunks, there may be problems with machines less than the Pentium 133. That's why we came up with the two-PC method.

Pro-Turbo on a 486 and Trunker or ETrunk on a PC-386 DOS machine were demonstrated to work okay. This should give you a guide....

Most problems in the beginning will be with Trunker or ETrunk but if you can test each separatetly first, then any TrunkFollowing problems will be easier to resolve.

Most issues with Trunker or ETrunk will be a learning curve. These two programs are freeware by an anonymous author who is concerned that Motorola and the federales might lop off his head and holler down his neck. As you might suppose, tech support for these programs isn't great. Support comes mostly from the public media where you post a question and someone offers an answer.

The docs for Trunker or ETrunk are okay, but not great. It will take a little plunking around to get a feel for how these hummers operate. Once you get that "feel", then you'll be tracking the trunks with the best.

I'm understating when I talk about TrunkFollowing at its finest. It works pretty slick and wicked!

Not unless you are a female with a child in the car, blocking
traffic, or are in a *really* bad spot with no lights.

Most cell providers will allow you to use a credit card to pay
for airtime - but it ain't cheap (~$2/minute).

One caveat to carrying an "emergency" phone is the batteries. You
cannot simply throw an old handset in the glovebox. After a few
weeks the batteries will be down to nothing (cellphones still
draw a tiny amount of power from the battery when off).

"So use a car adapter!" you say - BUT... most cell phones run off
their battery as the primary power and will not function without
the battery pack - the "power" jack just charges the battery. The
phone will not work until the battery accepts a charge.

We have all experienced NiCds that have sat around for dozens of
months unused - and they usually end up shorting out. You'll be
SOL on the side of the road without your "rejuvenation" gear. If
a cell or two is shorted - the phone ain't gonna work.

Cure? Remove the battery from the phone when stored to prevent
draining it (prevent cell reversal). Charge the battery every few
months.

You should also know how to change the phone from system "A" to
system "B" - and how to change between "digital" and "analog"
modes. Some "digital" systems use TDMA, and some use CDMA - but
"analog" is usually universal. Don't use a digital only as your

"emergency" phone.

If you do a lot of "back roads" traveling - consider a full-power
"bag phone" instead of a handset.

Most Caller ID chips contain all the modem "stuff" in one chip.
The raw "serial" outputs are not available. The outputs of these
chips are usually "microwire" or IIC outputs - not RS-232 type
"serial".

If the "stuff" coming in does not follow the Caller ID protocols
- the chip is probably going to ignore it.

> Does anyone have familiarity with any Caller ID units or the chips
> used for Caller ID demodulating?

See this page:

http://www.hut.fi/Misc/Electronics/telephone.html#signaling

Check Motorola, Mitel and M/X-Com. MX-Com makes many modem chips.

> If you are not familiar with the EMWIN broadcasts by NOAA run a

> EMWIN demodulators.

The chips used for amateur "Packet Radio" will work - such as
TI's TCM3105 - a favorite of packeteers.

A simple solution is to use a "Baycomm" type packet modem - such as the Ramsy kit - but you will need to re-wire the serial connector or make an adapter.

Sorry I could not help posting this mail I got from Bill in reply to a question I posted about Hooking up a RS232.Must be looking for another big sale on "real"??RS232's for you guys.This ought to start another long thread.I have withheld his address from the message

What is a JAV 232 Interface and where can they be obtained? Any web sites on 'em?

Bill

Had i wanted a bloody technical history, I would have asked for one..

However, I only want to sell the damn machine.. and the blurb in my email
was in fact from Yupiteru's old catalogue.. so , get real and either buy or
shut up...

bloody time waster...

Adam

: > summon police for a road emergency if it happens to be a patrolled
: > roadway.

: Not unless you are a female with a child in the car, blocking
: traffic, or are in a *really* bad spot with no lights.

: Most cell providers will allow you to use a credit card to pay
: for airtime - but it ain't cheap (~$2/minute).

: One caveat to carrying an "emergency" phone is the batteries. You
: cannot simply throw an old handset in the glovebox. After a few
: weeks the batteries will be down to nothing (cellphones still
: draw a tiny amount of power from the battery when off).

: "So use a car adapter!" you say - BUT... most cell phones run off
: their battery as the primary power and will not function without
: the battery pack - the "power" jack just charges the battery. The
: phone will not work until the battery accepts a charge.

: We have all experienced NiCds that have sat around for dozens of
: months unused - and they usually end up shorting out. You'll be
: SOL on the side of the road without your "rejuvenation" gear. If
: a cell or two is shorted - the phone ain't gonna work.

: Cure? Remove the battery from the phone when stored to prevent
: draining it (prevent cell reversal). Charge the battery every few
: months.

: You should also know how to change the phone from system "A" to
: system "B" - and how to change between "digital" and "analog"
: modes. Some "digital" systems use TDMA, and some use CDMA - but

: "analog" is usually universal. Don't use a digital only as your
: "emergency" phone.

: If you do a lot of "back roads" traveling - consider a full-power
: "bag phone" instead of a handset.

: Cheers,
: Paul Grohe

A better choice, if it is available for the phone in question, is a
battery case with normal non-rechargeable alkaline cells installed.
These have 3-5 years of useful shelf life, and thus the phone WILL work
when needed(if the phone draws too much current when it is "off"(normally
not), then leave the pack off the phone until needed.
Lithium AA cells have a even longer shelf life, but they are QUITE costly.

>Radio Shack's Trunktracker is made by Uniden...sorry

The 150 channel Trunking scanner is not. This unit uses triple conversion
and lacks the Uniden registered trademark "Trunk Tracker". Maybe they
contracted with another OEM to produce the Erricson compatible scanner.

==========
Bill Cheek's Scanner Data Decoding
Frequently Asked Questions File
==========

Contents
=========

01: What is a 'Discriminator Output' and 'baseband audio'?
02: How can I find the Discriminator Output in my scanner?

03: How do I connect to the Discriminator Output?
04: How do I build a decoder interface circuit?
05: So how do I decode digital data from the airwaves?
06: How can I decode CTCSS, DPL, and DTMF from the airwaves?
07: Is it possible to "TrunkTrack" without a TrunkTracker?

Questions and Answers
==========
01: What is a 'Discriminator Output' and 'baseband audio'?

There is a growing interest in tapping the baseband audio out of various scanners for decoding of a variety of esoteric signals, including CTCSS, SCA, FSK, RTTY, FAX, Pager data, and trunked system control data, etc. By and large, such signals cannot be taken from TAPE REC jacks, headphone jacks, and EXT SPEAKER jacks because of the voice-band filters that are between the signal source and these output jacks.

Therefore, it is necessary to tap the "baseband audio" directly at the output of the discriminator chip for your scanner.

==========
02: How can I find the Discriminator Output in my scanner?

Table 1 shows a list of scanners, the discriminator chip(s) used in the scanner, circuit symbols of those chips, and the baseband audio (discriminator output) pin.

If your scanner isn't listed in Table 1, then refer to Table 2 to find its discriminator chip. The chips listed in Table 2 are all known Discriminators used in scanners and wide coverage receivers.

Between Tables 1 and 2, you should be able to find the discriminator and its output pin for any reasonably modern scanner.

Corrections and additions to these lists are requested. See my email and other addresses at the end of this file.

Once you locate the discriminator in your scanner, you have to make its output conveniently available on the exterior chassis, much like a headphone or tape recorder jack.

Figure 1 below shows how to determine the pin numbering system for most integrated circuits. Looking at the marking side of the chip, there is either a notch or nook at one end, and/or an embedded "dot" off to one side at one end. The notch, nook, or dot signifies the end that starts with Pin #1 and ends with whatever the highest numbered pin happens to be. Most IC's have 8, 14, 16, or 18 pins.

==========

03: How do I connect to the Discriminator Output?

HOOKUP PROCEDURE
================

If you need the raw Discriminator baseband audio signal for external purposes, the best way to access it is via a jack installed in a convenient, unobtrusive location on the scanner.

1A BASE SCANNERS: Install an RCA or other jack in a desired place on the scanner's external case, typically the rear panel.

1B HANDHELD SCANNERS: If you can find the space, use a standard monaural 1/8" phone jack or a 3/32" mini phone jack. Some scanners are so cramped inside that even these won't fit. In that case a strip of 3 pinline sockets can be melted into the plastic case and wires soldered to the inside protrusions. The middle pinline socket is not connected to anything; it's just there as strength and support for the pinline plug you make, with the shield ground soldered to one end and the audio-center soldered to the other end:

GND---o o o---NFM DSCR (audio)

"Break-apart" pinline plugs/sockets are available from Mouser, DigiKey, and Hosfelt. These little puppies are good for a lot of hacker needs, so get a supply!

2. Connect the shell or outer frame part of the jack to scanner chassis ground. (Use one end socket for pinline connections)

3. Connect the (+) leg of a 1.0-uF to 4.7-uF tantalum capacitor to the Discriminator output Pin. (Capacitor should be tantalum, but can vary in value from 1.0-uF to 10-uF at a voltage rating of 16-35 vdc.)

4. Connect the center conductor of a shielded coax (RG-174, etc) or shielded mic cable to the (-) leg of the capacitor. NOTE: if the distance from the NFM tap to the jack is less than 3", then a single unshielded hookup wire will do fine.

5. Connect the shield of the cable at this end to a nearby PCB ground trace or spot.

6. Connect the center conductor of the other end of this
cable (or single hookup wire) to the center or hot lug
of the jack.

7. Connect the shield of the cable at that end to the
ground lug of the jack.

8. Fabricate or buy a shielded patch cable with one end to
mate with the new jack on the rear of the scanner at
that end....and the other end to mate with whatever jack
is on the tape recorder, processor, decoder, or whatever
device is to be connected at the other end.

Now you are ready to connect a data decoder interface to the
baseband audio output jack.

==========
04: How do I build or acquire a decoder interface circuit?

If you want to decode trunk control, MDT, pager, fax or
other digital signals, you will need to build or buy a
simple Interface to go between the NFM Discriminator/
baseband audio of the scanner and a standard serial port on
the PC.

If you are not capable of building your own, or if you don't
have the time to mess with it, I can supply an
assembled/tested Decoder Interface, built inside a DB-25
shell and connector with a 2-to-3 ft shielded cable
terminated with an RCA plug, for US$35 plus $5 S&H domestic.
See my signature box at the end of this article.

The DB-25 shell connects directly to a DB-25 comport on the
PC, or, if your comports are DB-9's, you can get a
DB25-to-DB9 adapter for it. You should, however, be able to
make your own following the below instructions.

This is a tried and true Data Interface circuit that is good
for everything we've tried, including a wide variety of
scanners. External power is not required. This circuit
draws its power from the comport. It is similar to the
"Hamcomm" and "data slicer" interfaces, but is optimized for
more scanners and more applications.

LEGEND:
o = soldered connection/junction
--|-- = crossover (no connection)
+|[= capacitor, polarized (see +)
>| = diode (anode->|-cathode)
|< = diode (cathode-|<-anode)
-/\/\/- = resistor
-->>> = ground

NOTES:
1. Use tantalum capacitors, +|[polarity as shown

2. Radio Shack's LM-741 works fine. Others might not!

3. Use 1/4 or 1/8 watt resistors to save space

4. Build circuit on a trimmed and fitted piece of perf board inside a DB-25 shell for max efficiency and space savings. DB-25 connects to PC's comport and a shielded

cable from the scanner goes to the input; shield is
ground and center is audio.

5. Many handheld scanners have no space to install a phone
jack for the NFM Discriminator Output. For such tight
spaces a strip of 3 pinline sockets can be melted into
the plastic case and wires soldered to the inside
protrusions. The middle pinline socket is not connected
to anything; it's just there as strength and support
for the pinline plug you make, with the shield ground
soldered to one end and the audio-center soldered to
the other end:

GND---o o o---NFM DSCR (audio)

6. For base scanners, install a female RCA jack on rear
panel.

7. For handheld scanners where there is space, use a 3/32"
mini or a 1/8" standard monaural phone plug.

8. 3.3k is an optimized value for most applications. If
the baseband audio output is less than 400-mV AC, you
can decrease the 3.3k resistor to 2.2k or even 1k if
needed.

9. Connect the interface to a comport on the PC. Plug the
input cable in to the scanner's NFM Discriminator
Output Jack. Tune to a desired signal and run the
decoder software of your choice.

10. If you are interested in using the "data decode"
scanner to control or "TrunkFollow" a second scanner,
then run a pair of wires off the Data Decoder Interface
from unused TxD (Pin 2) and Ground (Pin 7) out the back
of the circuit. This pair of wires will feed the RxD
and Ground pins of another COMport on the PC.

==========
05: So how do I decode digital data from the airwaves?

First, you tap the Discriminator Output in your scanner.
Then build the Decoder Interface and connect it to the
Discriminator Output. Then connect the other side of the
Decoder Interface to a com/serial port on your PC.
Lastly, run the software that decodes the particular
type of signal that you want to decode.

In general, it takes different software for different
kinds of signals, and I can't possibly cover them all
here. I will suggest that you start out with a free
program called TRUNKER that decodes the control data of
Motorola trunking systems. This is one of the easiest

to set up and get working; therefore, it makes a good test "platform" to prove up all your work before you venture into bigger and better things. Motorola trunk systems are fairly common now.

TRUNKER and a good set of documentation and limited support for it can be found at the following URLs (Web Sites):

http://www.geocities.com/CapeCanaveral/Lab/1060/beta.htm

or

http://web2.airmail.net/lblant1/dfw/digital.htm

==========
06: How can I decode CTCSS, DPL, and DTMF from the airwaves?

That is strictly up to specialized hardware and/or software that kind of goes beyond the scope of this FAQ. Lots of software is out and about that will do it, and there are even possibilities for "roll your own" hardware decoders.

But the first thing you'll need is the "baseband audio" output that is described in Questions/Answers #1-3 above. The Data Decoder Interface described in Q/A #4 is good ONLY for trunking and pager types of data; not CTCSS, DPL, and DTMF, unfortunately.

In fact, it takes specialized hardware and/or software to decode each of CTCSS, DPL, and DTMF; and each is as different as night and day.

Some scanners come equipped for CTCSS decoding, but most do not. And none come equipped for DPL or DTMF that I know of.

For more information about retrofitting CTCSS and DPL decoders to your scanner, contact:

Communications Specialists, Inc.
426 West Taft Avenue
Orange, CA 92865-4296
(800) 854-0547 Fax (800) 850-0547
(714) 998-3021 Fax (714) 974-3420
WEB: http://www.com-spec.com/

For a low-cost "roll-your-own" DTMF Decoder (hardware) there is a nice project done up in great detail in one of the back issues of the monthly WORLD SCANNER REPORT newsletter, V3N10. Backissues are always available at a nominal cost. See:

ftp://ftp.cts.com/pub/bcheek/products/prodinfo.zip

There are other hardware and software solutions for decoding DTMF that I may include here later as I get the information verified and added.

The WiNRADiO Digital Suite is awesomely capable of decoding CTCSS and DTMF. See: http://www.winradio.com

For scanners in general, though, it all starts with a tap to the "baseband audio" point, so read over Q&A 1-3 above for the details.

==========
07: Is it possible to "TrunkTrack" without a TrunkTracker?

It didn't used to be, but times do change and YES! It is now possible to track the trunks without a 'real' TrunkTracker Scanner, and better, for that matter!!!

Like the other subjects in this FAQ, it all begins with a Data Decoder Interface. See Q&A #4 and Note 10 in that answer for the tiny extra addition you need to make to the Decoder Interface.

Next, you need a PRO-2004, PRO-2005, or PRO-2006 scanner, although we hope to add other scanners to the list in due time. For now, it's one of those three.

Then you need a CE-232 Scanner/Computer Interface (or its predecessor, the HB-232). You will also need the hot, new Windows program for the CE/HB-232 called Pro-Turbo.

Lastly, you need one fairly modern computer, Pentium 133 or better, for the easiest way to track the trunks, but there is another way almost as easy, if you have two computers, one a 486DX2/66 or better and the other, a PC-386 or better.

There are other requirements, too, but the above are the main ones. It is beyond the scope of this FAQ to spell out all the details, but the V8N9 issue of the monthly World Scanner Report tells it all. You can order this or any other back issue of the World Scanner Report since Jan-91, including 6-mo and 1-yr subscriptions.

You can also download a more detailed text file on TrunkFollowing with the PRO-2004/5/6 from my FTP site at:

ftp://ftp.cts.com/pub/bcheek/ce-232/trnkscan.txt

For more information on the Pro-Turbo software for the HB/CE-232, contact:

Paul E. Turton
RR # 3; Wainfleet, Ontario Canada L0S 1V0

E-mail: pturton@iaw.on.ca or jabba@iaw.on.ca
Web: http://www.iaw.on.ca/~jabba/pro-turbo.htm

For more information on the CE-232 Interface, you can
download a file called PRODINFO.ZIP from:
ftp://ftp.cts.com/pub/bcheek in the \PRODUCTS directory,
or you can view and download all the individual files
from the \CE-232 directory. Or, you can ask for it as
an e-mail file attachment from: bcheek@cts.com

or see the information in my signature box below.

But yes, it is now possible to track the trunks without
a TrunkTracker scanner, and do it better than any of the
"real" TrunkTracker scanners! The cost can be a lot
less than the cost of a real TrunkTracker, too. The cost
largely depends on what you already have, or can
scrounge up, but at worst, it's well within the budget
of many scannists. Contact me for the latest on this
exciting topic.

==========
That's it for now. I will keep this FAQ updated. If you
see things that need to be added to it, by all means, let me
know. If this FAQ fails to address your question(s), then
hit me with 'em again, but be specific. And be detailed
with symptoms and observations if you need tech support on
mods or troubleshooting and diagnosis. Use e-mail.

I have a Realistic Pro-2036 scanner that locks up on several
frequencies when I turn on my computer. The scanner is located approx.
4 feet away from the computer on a separate desk. How can I remedy
this?
Also, any mod info on this scanner would be greatly appreciated.
Thanks.

4617. NEED: Southern California Freq

Newsgroup: rec.radio.scanner
Date: 1998-11-13 00:00:00 UTC
From: redog31@aol.com
Message-ID: <19981113055021.28875.00001229@ng42.aol.com>
Source record: 138266

Hey everyone, I need the frequencies for Golden West K-9. They are located in Pacoima, in the San Fernando Valley. The main service they provide is Metrolink Security, as well as radio dispatched patrol for residential and commercial accounts. I have the following information for them:

[Frequency] [Call Sign] [PL Tone] [TX City]
461.050 WNJX-577 PL=N / A Chatsworth
461.150 WNRO-464 PL=N / A Chatsworth
464.075 WNJU-231 PL=N / A Pasadena
471.2375 WIH-991 PL=79.7 La Crescenta

The problem is that I think this might be old and inaccurate data. I did not hear anything when I programmed these four frequencies into a bank and scanned them for about a half hour. If I recall correctly, their channel was fairly busy and traffic could be heard on it every few minutes. If anyone has any ideas as to what their new frequencies are, or if they can confirm that these are correct, send me an email. Thanks in advance.

Fix the TV. It's the TV owner's problem; if the CBer, or ham, etc
is operating legally, then it's legal.

> I would assume my right to operate a passive device _inside_ my home is more
> to be defended than a person's right to transmitt?

I have a license to operate an amateur station. If I operate it
with the allocated frequency bands with less than or equal to the legal
power limit, I am operating legally -- it is your problem.

It is not hard to create TVI; even my station here (max power is
about 25% of the legal limit here, which is only 120W on FM
anyway) causes interference to the TVs in the house. Yet my setup is legal.

Message-ID: <364C6540.25B5@hotmail.com>
Source record: 138269

Use an outside antenna, connected to the scanner by good quality shielded coax. Ground the scanner and the computer cases. Try putting ferrite cores on the power leads running into the computer and scanner, and also on the mouse, keyboard, monitor, and speaker cables as they exit the computer. If possible, move the scanner as far away from the computer as you can. Even with all this, you'll probably still pick up some interference....

Cross-posted to: rec.radio.scanner,sci.electronics.repair,alt.radio.scanner

Anyone out there have any experience with
this issue?

I have 2 Pro-2004's both bought brand new,
and they worked fine for years. Both now
have developed the same set of symptoms...
When I key in a frequency such as 155.535,
the display goes to something weird like
861.612 or similar...

Tried the basic stuff, replaced the 9v
battery, reset the CPU, got a service manual
and looked at the power supplies, 5V and 30V
DC-DC converter look okay...

I am assuming that if I am two for two in
Pro-2004's with this issue, someone else must
have seen it also. Any ideas where to look
in the circuitrty or on the web for info
would be appreciated.

Remove the "NOSPAM" to reply to me directly,
or post here for others to benefit.

Thanks in advance,
Mac

Two portable shortwave radios for sale --

1. Sanjean ATS-803A - $1OO, plus UPS shipping

Larger size (like Sony 2010), full-coverage (150kHz-30MHz), BFO/SSB, digital display, tuning knob, 4" speaker, FM w/ stereo on headphones, 9 memories, 24hr clock/alarm/sleep modes, runs on 6 D-cells and 2 AA-cells, comes with shoulder strap, AC power supply, box and manual. Excellent condition! Did the simple mod to eliminate chuffing - hear the DX. This radio got excellent/best-buy reviews in Passport to World Band Radio. Was also sold as the Realistic DX-440. Discontinued price was $150 ($200).

2. Sony ICF-SW-7700 (no, not the SW-77...) - $50, plus UPS shipping

Smaller, world band radio, AM/FM/LW/SW, digital, tuning knob, has large LCD showing tuning bands (like an analog radio) and also shows digital readout of frequency, includes Japanese FM band below 87 Mhz, runs on 4 AA-cells, has power and mono-earphone jacks, 24hr clock/alarm/sleep modes, 5 memories on each band, comes with nice faux-suede case and manual, no box. Very good condition. This radio makes a nice travel unit or gift for a beginning SWL. Amazingly easy and intuitive to operate.

If interested, send email to me at: ajninno@syr.edu

Acutally, the government has not banned the mil band from scanners.
But, crappy Radio Shack has banned you from getting the schematics to
their scanners, and now, they are banning the mil frequencies from
scanners.
Soon, scanners will be back to listening to 1mhz to 40mhz or they will
simply go away.

That would be Bill Cheek at bcheek@cts.com. Bill's real strong in the 2006 department and sells and/or installs the CE-232 computer interface. You can contact him for more info on plans, kit, or even fully installed & bench tested. Your choice.

Contact Bill at bcheek@cts.com

This sounds like a problem in the memory subsystem, perhaps
a bad RAM chip or bad solder joint. Also check for clean
power on the logic board.

BBWOLF <bigbadwolf1@earthlink.net> wrote:

>I have a 2004 with a "flaky" problem too. Mine scans fine, and then

There is a very good chance that poor soldering is the culprit.
I'd start by redoing all the joints in the power supply area
on the main board. If this doesn't fix it, move on to the logic
board.

4641. HELP with discriminator tap

Newsgroup: rec.radio.scanner
Date: 1998-11-14 00:00:00 UTC
From: joe22579@my-dejanews.com
Message-ID: <wgcid$$3cNG00$i72lmo3$24ijd241knnrp1$idejanews$icom$3e$j00000212@gratisnet.com>
Source record: 137940

I have had trouble making a discriminator tap for my PRO-51 portable scanner. Upon viewing Bill Cheeks Scanner Data Decoder FAQ, it showed that the chip to find was the following:

PRO-51 MC-3361BD IC-1 9

I found the chip, printed on top where the exact numbers listed above. I could not find any indication as to the IC-1 info. I found a printed line dot on the chip closer to the top left than the right, I am assuming it was indicating that pin one was on the top left.

The diagram below indicates what I found. The scanner back casing removed, the BNC connector would be on the left and the battery compartment on the right. Reading the chip in this position would allow it to be readable as versus being upside down.

IC CHIP PINOUT

Chip found has no Notch, or indent. It has a printed line dot as above.

According to documents I figured pin nine would be bottom right. Tapped this pin with a Tantalum high capacity 1.0uF 35 WVDC (272-1434A part number) attaching + side of capacitor to pin nine. Attaching a small wire to - side of capacitor and to Hot side of 1/8 female MONO jack. The other terminal for the jack was attached to a ground spot on the board.

When attaching a MONO 6' shielded patch cable (42-2387 part number) to female 1/8 3.5mm mini phone jack (274-251a part number) with the other end of patch cable to sound card, the software received no noticeable sound. The speaker on the scanner would still provide sound however at full blast on volume speaker sound was hardly noticeable. When patch cord removed speaker would function. When patch cord connected to original 1/8 headphone jack the software would see sound.

Also note the wire I used insulated wrapping wire 30awg (278-502), very small.

Does anyone have any ideas why this did not work? Did I find the right chip and or pin? I think I followed directions but does not work, I have checked connections and hookups several times. Could the small wire cause this problem? Any recomendations as to wire size to use?

> ... what frequencies and ranges of frequencies the "Service" scan feature
> scans?

You're hearing what is called the "T-Band". In certain US cities the FCC
has allocated parts of TV channels 14-20 for mobile radio use. In particular,
482.0125-484.9875 (part of TV ch 16) is available for multiple uses in
Boston, Dallas/Ft.Worth, Detroit & San Francisco and for only public safety
in Los Angeles.
Uniden programmed the BC235 with every possible frequency for which
there is a police authorization. If you want to know exactly what a service
scan encompasses, turn the squelch all the way down, press SVC and then hold
the up-arrow key. The radio will step through every one of the freqs, at
about 4/sec. If you watch carefully, you'll even see the mistakes (such as
the two just after 478.7375).

Last year at this time, you could buy either the European CPU or the
entire Logic Board from Javiation.......BUT, as of a few months ago,from
what I understand,Radio Shack got together with GRE and somehow presuaded
GRE to no longer sell the " Cellular Capable CPU or Logic Board " to
companys like Jonathans. (Javiation)
I think it really sucks but , what the hell can you do??

Perhaps because -
A) The range cited covers Industrial / Mobile Phone / Government /
Forestry / Trucking / Maritime / Broadcast remote pickup / etc.
The actual AAR channels cover 160.215 - 161.565 in the U.S.
or
B) The BNSF operates a major yard at Barstow with at least 18 active
frequencies, none of which are the road channel the poster wanted
(listening to the hump channel can be very boring, at least until
you hear the controller cry "Ooohhh, shit!!", followed by the sound
of crunching freight cars).

You might try a military surplus store or a surplus electronics
dealer. Try All Electronics:

http://www.allcorp.com

Or Alltronics:

http://www.alltronics.com

If you hadn't said "reasonable", I'd say try a photographic supply
store.

For Sale and Wanted

If anyone needs any of the old Motorola Tone (pager) Reeds, here is what I have.

TLN6709 or KLN6209. Used in the Motorola Alert Monitors..The ones with the handle on the side of the unit. I have many of these Tone Reeds. Let me know what you need or lets trade if you have any. I need: 346.7 CZ, 524.8 GZ, 473.2 FZ, 697.5 G13

KLN6202B. Used in the Motorola Minitor Pagers. I have many MZ and GZ Tone Reeds. I need: 697.5 G13. I also have extra crystals for 154.415 to get rid of. Let me know what you need or if you have any, lets trade.

I Need Crystals for Scanners. I have some to get rid of also. Lets work out a trade if you have some you don't need. I need: 154.785, 154.175, 154,445, 155.325, 155.595, 155.490.

Thanks Everyone.

That would be Bill Cheek at bcheek@cts.com. Bill's real strong in the 2006 department and sells and/or installs the CE-232 computer interface. You can contact him for more info on plans, kit, or even fully installed & bench tested. Your choice.

Contact Bill at bcheek@cts.com

In article <uuMf7kDE#GA.214@upnetnews05> it was written:

>Bought a Bearcat 20/20 today
>because I needed a scanner that receives the air band.
> Does anyone know
>what the function of the switch marked *position A/B* is?
> Also, any idea how old this scanner might be.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with
40 channels and different CPU circuitry. A maximum of 20
channels can be scanned at one time. Reasonable number of
features. Service Search for Marine and Aircraft. LED
readout. Good scanner, but tinny audio.

The A/B switch selects between two different sets of 20 channels.

If there are "no gaps" it will cover from 500 Khz to 1,300 Mhz
continuously. Also has FM, AM, WFM, USB, LSB and CW modes as
appropriate to the frequency.

The audio is really muddy sounding in the vehicle even with an external speaker..I have mine in a 1986 toyota 4-runner with a fiberglass top which runs from the frontseats towards the rear of the truck. I used kitchen stickem type hooks and placed them all around the ceiling to hold a 50ft long wire. This worked great!!! The wire makes 5 revolutions around the ceiling of the truck. Watchout how you run your coax though. I ran mine along the passenger side of the truck and didn't know that the main engine "brain" box was located there. Lots of noise, s9+. Had to relocate the coax run from the dash to the end of the truck. On a scale of 1-10 and 10 being the best. I would say that the Icom is about a 6 on the scale for shortwave and mediumwave, and a -8 on longwave.
Dan

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip

using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some of the newer models, like the Uniden SportCat and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 and PRO-60 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Looking for value? At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value and available at most Wal-Mart stores. The RELM HS200 portable performs very well is an excellent value at its $250 street price.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-64 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna

Co., Inc. and is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

For information on "virtual downconverter" modifications, see Steve Donnell's article in January 1995 RCMA Scanner Journal or February 1996 Monitoring Times. Reprints of articles from Monitoring Times are available for $3.00 each plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (828)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of this reprint fee.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins

Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, www.grove.net) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency

lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the

scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.wildstar.net/~plaws/scan/scan-l.txt

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

All meetings are held on Saturdays at locations announced
in advance. The next meeting is December 5, 1998 at
Philly's. The 1999 meeting schedule is: Febuary 6, April
3, June 5, August 1 October 2, and December 4.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in

plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to

cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.
1142 N. Gilbert St.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $49 instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was

permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and

store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi

antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

HAMFEST/COMPUTERFEST CALENDAR 1998 - NORTHERN ILLINOIS
last updated October 30, 1998 |

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, Tom Harker, and ARRL for providing some of the information.

NOVEMBER 1998

Nov 22 (Sun), Wheaton, IL. GMRS Electronics Flea Market. Dupage County Fairgrounds. Sponsored by GMRS of Illinois, Inc. Admission $5. Kids under 12 free. Open for setup at 6:30 AM. Building doors open for buyers at 8 AM. Info: (815)756-3933 or (630)393-3937.

Nov 28 (Sat), Grayslake, IL. Computer Country Expo (see details below). Lake County Fairgrouds.

DECEMBER 1998

Dec 19 (Sat), Grayslake, IL. Computer Country Expo (see details below). Lake County Fairgrouds.

JANUARY 1999 |

Jan 24 (Sun) - Villa Park, IL - Wheaton Community Radio | Amateurs Mid Winter Hamfest - '98 at the Odeum Exposition | Center 1033 N. Villa Ave., Villa Park, IL. |

Info: Pat Byrne, K9JAU, 414 North Park Blvd., Glen Ellyn, IL | 60137. 630-545-9950. E-mail: k9jau@juno.com, | http://www.w9ccu.org (Held inside and is usually crowded. - | AJ9S) |

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (847)974-3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer expo. The event is held on designated Saturdays from 9:30 AM to 3:00 PM. This show features computers, supplies, games, parts, software, accessories, CD-ROM, monitors, diskettes, printers, keyboards, modems, disk drives, cables, expansion boards, services, and anything else in the domain of computers! Lake County Fairgrounds, Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall Building #1=9720,000 sq. feet of everything Computer! For a show map, exhibitor info, and discount coupon, visit the web site at http://www.ccxpo.com.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1998 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be

heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig replaced a 22uF/35V C98 capacitor to repair his BC210XW.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints. |

Matt Roberds repaired the Montgomery Wards version of a | BC220 and contributed these insights: |

"I did add some heat-sinks, but you have to be careful what | you do with the TIP29 on the logic board. I added a long, | flat heatsink to it and immediately created a whine in the | audio. I didn't use an insulator, as this was a temporary | first-try. As far as I can tell, the heatsink was | radiating noise from the logic board into the front end on | the radio board, which ended up being just below the | heatsink. Bypassing the TIP29 (a voltage regulator) with | disc ceramics didn't work; using a smaller heatsink and an | insulator fixed the problem." |

"There is also a 220 ohm 1/4 watt resistor on the logic | board. It feeds the TIP29 from the main +16v supply. It | looked a little crispy. I pulled one end and measured the | current through it and it was about 30-35 mA. This works | out to right at 0.2-0.25 watt dissipation. I didn't have a | higher-wattage resistor, so I substituted 2 470-ohm | resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when

powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855. email rlassoc@inav.net

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1998 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)442-2425 or (817)870-5600, or through your local Radio Shack store

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A crystal scanner are not working and the lamps for those channels won't light, replace IC4 or IC5 (type 7400A).

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz
band, so there were versions optimized for each portion of
the VHF-low band. There were different versions to cover
low and high "splits" in the VHF-high band, too. For
example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49,
and 49 - 54 MHz versions. There are two VHF high band

versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Minimum Volume Setting

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137

telephone (540) 347-7760
email: weber@citizen.infi.net

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone
(800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model	UHF	VHF-high	VHF-low
SM-301	X	X	X
SM-302	X	X	
SM-303	X	X	
SM-304	X	X	

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

SCANNER RADIO REVIEW BRIEFS

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than 70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor receivers of various brands in my collection. This article describes a few of the FM receivers in my collection, and other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews and modifications of these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Oct 1996 - Radio Shack PRO-2046 mobile
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Aug 1998 - Sony SC1PC portable
Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech

inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

ICOM

R-10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with

little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the

schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel

interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen,

police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob.

Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging

capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring

Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn

on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt

alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob

Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands

programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an

optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Model	#chan-nels	VHF low	VHF high	UHF scans?	lock-outs?
FR104	6	X		no	
FR105	6	X		no	
FR2512	24	X		no	
FR2513	24	X		no	
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough

condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard

or $34.95 for deluxe RadioMap report with histogram.
Include your name, address, and telephone number, along with
center location (nearest intersection of 2 streets, or
latitude & longitude) and mail to: Bob Parnass, 2350 Douglas
Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central
time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each,
but you must know the patent number. Credit card orders are
taken over the telephone by the Assistant Commissioner for
Patents at (703)305-4350. Alternatively, you can mail a
check or money order, made payable to "The Assistant
Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark
Office, call their automated information message system
toll-free at (800)786-9199.

There are various patent servers on the world wide web,
including IBM's server:

http://patent.womplex.ibm.com

>Period.

I doubt that anyone would disagree with you since overseas is the only option for buying a Yupi. The issue is that he's happy doing business with Bandercom and they are standing by the products they sell. Not much to disagree with there, is it?

I have already placed my order for the Yupi-to-be-named-later with computer control that is slated to debut in February. I can't wait.

Why the hell was all of this "writing" going on? Don't you have a phone?
It takes at least a week for a letter to get to Europe from the States.
Are you living in the 1700's or what? Maybe if you would pick-up the
phone and spent $2 on a LD call you could have solved this problem in
half the time. And maybe if you had spent $25 USD for shipping your
radio via Fedex,it would not have been lost in the U.S. Post "Black
Hole" for 5 weeks. What an idiot!!! Moron Moron Moron.

BTW, don't e-mail me, drop a letter in the box shit for brains!!!

Perhaps you should note that I am rebutting the argument of the reply complaining about people using Bandercom, etc. I was not replying to the original post, but replying to the reply. I was NOT complaining about them, but defending them. I use them!

Then, if you order an MV9000 from
Bandercom, and they ship it to the U.S.,
isn't it illegal for them to ship it to the U.S.
because it receives cell phones?

Nope, they don't have any laws against exporting cell-capable Yupis. We have a law against importing cell-capable radios, however.

It's what you are doing that is illegal, not what they are doing!

Should I tell him guys?

Aside from the fact that what he wants to do is illegal,

Unless the copy of HT1000 software he has is ancient,
it also is the software for the JT1000.

If it is ancient, then it is not too good a trade.

Now, see, this is what I'm talking about. This guy may be
completely honest, and may be sending you the radio you paid for. But
because of the hysterical nature of the original post, you are
beginning to *assume* that anyone in Ky, or Louisville for that
matter, is not to be trusted. Anytime you buy something from the 'net,
you assume more risk than if you bought it in a store. This is the
nature of the 'net. If you don't want the risk, hit the pawn shops.
Just don't make blanket assumptions without some hard evidence.

Pete.

4733. FS: SCANNER CRYSTALS (10.7 MHz IF)

Newsgroup: rec.radio.scanner
Date: 1998-11-14 00:00:00 UTC
From: scan911@aol.com
Message-ID: <19981114100904.17166.00001629@ng133.aol.com>
Source record: 138120

SCANNER CRYSTALS FOR SALE
(this information also is at http://members.aol.com/scan911/xtols.html)

I have the following Regency-type 10.7 MHz IF scanner crystals for sale.

The scanner crystals are $2.50 each, postpaid. All payment must be in advance, and checks are acceptable as long as your name and address are printed on them. Please feel free to e-mail to check on availability (there are multiples available on some crystals, as noted). All requests to hold specific crystals will be for one week only, after which they will be made available again if payment is not received.

Mail check with list of requested frequencies to:

SCAN Communications Co.
Box 11
Iowa City IA 52244-0011

Most crystals have been removed from scanners and are used. Those that are new are marked as such. Except for VHF low band crystals, we will attempt to test all crystals before mailing.

Thank you!
73, Chuck Gysi, N2DUP

Message-ID: <72ilgn$72p$1@nnrp1.dejanews.com>
Source record: 138231

I have a Radio Shack Pro-43 handheld scanner for sale.

Here are the details:

- good to very good condition
- the diode has been moved giving it 870-890 MHz and 51-88 MHz coverage
- no other mods done
- original rubber duck antenna
- all packaging and manual
- pro-64 leather case included (fits pro-43)
- everything on the radio works - never had any problems
- FCC ID number AA020-300A, serial number 077222

I would like $225 (COD), and we can split the shipping.

If you are interested, please e-mail me at: longbch@juno.com.

Thanks,
Kelly

Assuming you have win 95 or 98, go to control panel. Click on the system icon, click on device mgr., click on com ports. If you see com 2 there, highlight it and click on properties, the click on resources. See if the irq is 3, io adress should be 02f8. Don't change anything if it is not. It can have other addresses and or io's and be ok. If it isn't there, Go to setup on boot up(where it says press delete or F1) and then to the peripheral page(you might have to look at other pages in setup...I think the com port settings are there) and see if com 2 is enabled. If not, enable it. Then back to device mgr and take a look. If it is still not there, go to control panel and click on add new hardware icon. If you have the option to " NOT let windows search", do it. Specify you want to add a com port or communications port. Then follow through with what windows asks you to do. Then after that you should see com2 in device mgr. There are of course some variables here, so, email me if you have questions. Cal

4747. 14.300/14.313...The Daytime ZOOS of Amateur Radio

Newsgroup: rec.radio.scanner
Date: 1998-11-15 00:00:00 UTC
From: cbrambo@aol.com
Message-ID: <19981115185908.18121.00000940@ngol01.aol.com>
Source record: 137883

Spent some time this afternoon listening to these frequencies. Seems to be a "daylight version" of the chaos that takes place nightly on 75m. Some of the same players, too. Porkbutt on 14.300, talking endlessly about his ongoing litigation. Couldn't hear all of it, though, as he was interrupted regularly by jammers of all types, sizes, and colors. Over on 14.313, an ongoing argument regarding the merits of Herbie. Pro-Herbie vs anti-Herbie forces. Lots of jamming here, too, incuding one very powerful station who overrode all others at my location by playing tapes of herbie speaking on previous occasions. Fun stuff. Welcome to amateur radio in the late 90s.

"Where's that big 'ol CB RAMBO??"
"I wanna hear him TALK TOUGH!!"

4751. MDT Monitor Program for Windows, updated 11/15/98

Newsgroup: rec.radio.scanner
Date: 1998-11-15 00:00:00 UTC
From: Gordon Edwards <gordone@jps.net>
Message-ID: <364f92c7.0@blushng.jps.net>
Source record: 137887

I've written a Windows program which allows you to monitor MDT traffic on systems that use Motorola's MDC-4800 protocol by plugging the discriminator output of your scanner into the microphone/line-in input of your soundcard.

The program (and source code) are available at
http://www.jps.net/gordone/mdt

Features:

- Uses the sound card to acquire the data to decode, doesn't require the use of a data slicer. Just plug the discriminator output of your scanner into the microphone/line-in input of your sound card and away you go.

- An "MDT" window displays received MDT traffic the same way it appears on the terminal to which it was sent.

- A "Terminals" window lists all of the terminals to which data has been sent since the program was started. You can select a terminal from this list to see the last 30 messages sent to that terminal.

- A "Messages" window displays summary information of only the traffic you want to see, configurable via rules you setup.

- The raw ASCII MDT data which the program is interpreting can be viewed in a seperate window and also captured to disk.

- A machine running MDT Monitor with a scanner can act as a server to other machines running MDT Monitor which don't have scanners connected to them. The MDT data received by the machine with the scanner is sent to all of it's MDT Monitor clients.

Please send comments/suggestions to me at gordone@jps.net

Enjoy,
Gordon

I realize this has probably been asked many times, but I would like to know if it is possible to decode alphanumeric pager signals using computer software or TNC. Do you have to have codes or PIN numbers for the pagers, or can you monitor all pager traffic on a frequency? Any info on this subject will be appreciated.

>what the function of the switch marked *position A/B* is?
> Also, any idea how old this scanner might be.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with
40 channels and different CPU circuitry. A maximum of 20
channels can be scanned at one time. Reasonable number of
features. Service Search for Marine and Aircraft. LED
readout. Good scanner, but tinny audio.

The A/B switch selects between two different sets of 20 channels.

This sounds like a problem in the memory subsystem, perhaps
a bad RAM chip or bad solder joint. Also check for clean
power on the logic board.

BBWOLF <bigbadwolf1@earthlink.net> wrote:

>I have a 2004 with a "flaky" problem too. Mine scans fine, and then

>joints. I haven't had I chance to get mine checked yet!

There is a very good chance that poor soldering is the culprit.
I'd start by redoing all the joints in the power supply area
on the main board. If this doesn't fix it, move on to the logic
board.

4776. HELP with discriminator tap

Newsgroup: rec.radio.scanner
Date: 1998-11-15 00:00:00 UTC
From: joe22579@my-dejanews.com
Message-ID: <72lmo3ijd1@nnrp1.dejanews.com>
Source record: 137956
Cross-posted to: alt.radio.scanner,rec.radio.scanner

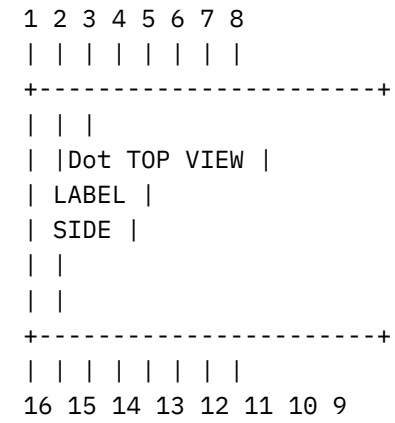
I have had trouble making a discriminator tap for my PRO-51 portable scanner. Upon viewing Bill Cheeks Scanner Data Decoder FAQ, it showed that the chip to find was the following:

PRO-51 MC-3361BD IC-1 9

I found the chip, printed on top where the exact numbers listed above. I could not find any indication as to the IC-1 info. I found a printed line dot on the chip closer to the top left than the right, I am assuming it was indicating that pin one was on the top left.

The diagram below indicates what I found. The scanner back casing removed, the BNC connector would be on the left and the battery compartment on the right. Reading the chip in this position would allow it to be readable as versus being upside down.

IC CHIP PINOUT



Chip found has no Notch, or indent. It has a printed line dot as above.

According to documents I figured pin nine would be bottom right. Tapped this pin with a Tantalum high capacity 1.0uF 35 WVDC (272-1434A part number) attaching + side of capacitor to pin nine. Attaching a small wire to - side of capacitor and to Hot side of 1/8 female MONO jack. The other terminal for the jack was attached to a ground spot on the board.

When attaching a MONO 6' shielded patch cable (42-2387 part number) to female 1/8 3.5mm mini phone jack (274-251a part number) with the other end of patch cable to sound card, the software received no noticeable sound. The speaker on the scanner would still provide sound however at full blast on volume speaker sound was hardly noticeable. When patch cord removed speaker would function. When patch cord connected to original 1/8 headphone jack the software would see sound.

Also note the wire I used insulated wrapping wire 30awg (278-502), very small.

Does anyone have any ideas why this did not work? Did I find the right chip and or pin? I think I followed directions but does not work, I have checked connections and hookups several times. Could the small wire cause this problem? Any recomendations as to wire size to use?

Since that stretch of road is known as Cocaine Alley, there's probably a lot of DEA and federal / state inter-agency comms but I would expect they are encrypted.

>some interference....
>
>

I find that keyboards are usually the worst offender. Put a ferrite core at
the back of the keybaord, not at the CPU cabinet. My HP IIIP printer also
makes noise, but a core on both ends of its cable clears that up.

Cheers,
H Higgins

Go for portability! You'll pick that sucker up and head out the door alot more than you think. This I say from experience. Plus, I find it fun to scan for frequencies while on the interstate, etc. The 235-XLT has been a good unit for me so far.

There's a place that will sell the Yupiteru MVT 7100 to me for
about $299 , now I've heard this is the best scanner to get for around
this price, does anybody have a different opinion?
I also want to buy any extra accessories I might need like an
antenna. Is a seperate antenna really necessary or will the antenna on
the Yupiteru suffice? If I might need any other accessories please
tell me.
Also, why is the Yupiteru 7200 hard to find and how much does it
cost?

Paul's verbal abuse, libelous comments, and threats on newsgroups have gone unchecked for over a year now. And it's because none of us have bothered to call him on it. Well, the time has come. Get this guy kicked of the internet. Teach him that his insulting ways don't go with us. And if he gets another account and does it again, we'll get him kicked off that one. Here's what you can do. Send an email to account@pacifier.com complaining about Paul's many inappropriate, way-off-topic comments to the various newsgroups. Tell them he deserves to be canceled. Tell them why. The text below is from pacifier's "Acceptable Use Policy" from their web page. Note, that they DO respond to complaints and that Paul is violating many of their rules for appropriate newsgroup postings. Get this jerk kicked off. We got to send him the message.

> Pacifier does not attempt monitor or censor newsgroup posts by our customers. Any action Pacifier
> takes is usually driven by complaints received by readers of the various newsgroups. We do not
> consider requiring that our users not make "off-topic" posts or that they not post material in violation
> of federal, state, or local laws to be censorship.
>
In other words, they will kick someone off for it if there are enough complaints and if the posts are found to be "off-topic".

> Pacifier considers the following type of postings to be inappropriate:
>
> Messages that have little or nothing to do with a newsgroups topic.
>
Well over 50% of Paul's posts are off-topic. They are insults that have nothing to do with the newsgroup whatsoever.

> Messages with content that violates federal, state, or local law.
>
Hmmmm. Like threats and libelous comments???

> Excessive cross-posting (the same or similar message posted to a large number of groups).
> Any posting which violates the charter of the newsgroup in which it is posted
>
> Commercial advertisements that are off-topic and/or excessively cross-posted are specifically

4790. Re: FRS freq's

Newsgroup: rec.radio.scanner
Date: 1998-11-15 00:00:00 UTC
From: Rupert Ramirez <warrior5@gte.net>
Message-ID: <72m7ob$jm4$1@news-2.news.gte.net>
Source record: 137970

```
--------------------
Family Radio Service
--------------------

The FCC has created a new Citizens Band service in the 460 MHz band.
It's called the Family Radio Service (FRS), and is designed to be an
unlicensed, "Very Short Distance Two-way Voice Radio Service." The FCC
Report and Order creating the service was released May 15th, and will
become effective sometime in June (30 days after publication if the
Federal Register).

The specifics:

FRS will permit handheld operation, with 1/2 watt ERP and "rubber-duck"
type antennas only, on 14 frequencies in and around the GMRS radio
service at 462 MHz. The exact frequencies are listed below.

No external antennas or amplifiers will be permitted.

To avoid interference with GMRS stations, FRS radios will be required to

use only 2.5 kHz deviation, half the usual narrow-band FM deviation of 5

kHz. Transmit audio frequency response is limited to 3.125 kHz.

Frequency stability is tight as well -- transmitters must not drift more

than plus or minus about 500 Hz (.00025%). You'll find typical ham
radios on UHF up to 1000 Hz off frequency.

Subaudible tone and other selective calling methods are permitted.
Autopatch or other telephone interconnect is prohibited.

Antennas must be an integral part of the radio, and must be vertically
polarized. (I suppose that means you can't hold the radio sideways
while transmitting?)

FRS is an unlicensed service, and there are almost no restrictions on
the content of FRS communications.

The FRS channel frequencies are:

Channel No. (MHz)

1..................... 462.5625
2..................... 462.5875
3..................... 462.6125
4..................... 462.6375
5..................... 462.6625
```

6..... 462.6875
7..... 462.7125
8..... 467.5625
9..... 467.5875
10..... 467.6125
11..... 467.6375
12..... 467.6625
13..... 467.6875
14..... 467.7125

$299 seems a fair price for the 7100, maybe a little steep (it's an older radio). I own one and love it. Make sure you get the manual, as it's a little tricky to program. It doesn't do trunk tracking, or have PL receive, but it's got killer sensitivity and great freq coverage and audio quality. The telescoping antenna supplied with the radio works fine. Mine overloads when hooked up to high gain outside antennas. You will want about a 10 meter long length of ordinary wire for shortwave work, try hanging it outside a window. If it overloads, try a shorter wire. Get a good case for it, too, the plastic case on the radio isn't very shock resistant. If you need trunk tracking consider the bc-235xlt. If you want ctcss receive consider the relm hs-200 hanhdheld. The repair / support situation in the USA is pretty poor. Try these sites for more info-

big bloated flames like this are just as much a pain in the ass as some asshole making other bogus posts...

get a hobby or something better to do with your time than being the pacifier censorship cop...

Fredrick B Ingles wrote in message <364EA1C3.E0D86EB3@teleport.com>...
Paul's verbal abuse, libelous comments, and threats on newsgroups have gone unchecked for over a year now. And it's because none of us have bothered to call him on it. Well, the time has come. Get this guy kicked of the internet. Teach him that his insulting ways don't go with us. And if he gets another account and does it again, we'll get him kicked off that one. Here's what you can do. Send an email to account@pacifier.com complaining about Paul's many inappropriate, way-off-topic comments to the various newsgroups. Tell them he deserves to be canceled. Tell them why. The text below is from pacifier's "Acceptable Use Policy" from their web page. Note, that they DO respond to complaints and that Paul is violating many of their rules for appropriate newsgroup postings. Get this jerk kicked off. We got to send him the message.
Pacifier does not attempt monitor or censor newsgroup posts by our customers. Any action Pacifier
takes is usually driven by complaints received by readers of the various newsgroups. We do not
consider requiring that our users not make "off-topic" posts or that they not post material in violation
of federal, state, or local laws to be censorship.
In other words, they will kick someone off for it if there are enough complaints and if the posts are found to be "off-topic".
Pacifier considers the following type of postings to be inappropriate:

Messages that have little or nothing to do with a newsgroups topic.
Well over 50% of Paul's posts are off-topic. They are insults that have nothing to do with the newsgroup whatsoever.
Messages with content that violates federal, state, or local law.
Hmmmm. Like threats and libelous comments???
Excessive cross-posting (the same or similar message posted to a large number of groups).
Any posting which violates the charter of the newsgroup in which it is posted

Commercial advertisements that are off-topic and/or excessively cross-posted are specifically
disallowed. Users are referred to our help section (http://www.pacifier.com/help/), the newsgroup
"news://news.announce.newusers" or http://www.stopspam.org for more information on what constitutes inappropriate posting to newsgroups.

Depending on the severity of the violation the account from which such messages originate and/or

benefits from such messages, may be suspended or terminated. Pacifier reserves the right to charge
the user a fee of $500 for each occurrence in which a news posting draws complaints for the above
reasons.
Wow! Wouldn't that be nice. If only they paid the proceeds of these fines to the victims of Paul's abusive posts.
Let's take action. email them now!

Yes that is what it sounds like to me also. A friend had the same kind of problems with his 2004 checked everything and changed the ram chip a bunch of times and worked fine till it was put into scan mode then it went to hell so time for another ram chip. Couldn't find anything wrong with it so he got a 2006 cpu board and interfaced it to the rest of the 2004. Works GREAT!

This is as to be expected on an unlicensed, unregulated service such as CB. But why does this nonsense continue day after day on amateur radio? I thought hams were supposed to be an elite bunch of serious, professional operators. They always look and talk down to CB'ers, yet the crap I hear on 75m and 14.300/14.313 on a daily basis makes Channel 19 look like a Sunday School picnic by comparison.

"Where's that big 'ol CB RAMBO??"

Hello,

I am a very frequent short-wave listener. I am using a TS930 from Kenwood
with a 3 element beam on about 16m .
Now I am searching for a recent list of frequency used by the American
airforce and seaforce.
Also a place where I can find them.

Many thanks in advance.

Filip

As if we don't know how anti-Ham you are, Rambone. This 75/80m garbage is not news, it's our version of 11m. Notice how these hams, although breaking just about every other section of Part 97, still ID after most of their QSOs? I don't condone it but let's save this tidbit for the SWL or Ham NGs. About the lowest freq I feel should be covered here is 29 MHz. Tell the scanner enthusiasts to listen to 29.6 MHz during this upcoming meteor shower Sunday and Monday. Those are hams that exemplify the finest points of amateur radio.
73,
Steve

You will never get anywhere without tapping the discriminator output!
NEVER! On your 2006, it is VERY easy. Look inside for a pin sticking
up out of the board marked TP-2. This is the discriminator output. Get
a cable that has the right plug for your interface, on the other end
put alligator clips. Clip the ground to the case and the tip to TP-2.
You will now decode everything and will soon be drilling a hole in the
back for an RCA jack!

Usually, you are talking about a standard "modem cable" that plugs in between the serial port on the back of the computer and the radio. Usually, we're taking 9-pin connectors. If you have two serial ports on your computer, all the better, just make sure your scanner software knows your cable is in Com2 or Com1.

Now, if you want to know how to write the program, that's another thing entirely. I can do it, as I do this type of stuff for a living, but I generally suggest that people buy a scanner control program that will work with your particular equipment; don't try to write it yourself unless you're really up for a challenge.

Hi,
Ok first of I am a computer dummy for the most part despite
haveing
built the one I have.I bought a JAV232 interface made by
javiation.I got an
adaptor to go to my 25 pin serial port and plugged in the
interface and also
the connecting ribbon to my AOR8000.I went thru the steps to
configure the
8000(expert mode,remote,9600 baud)
I have different programs to try like 8K,PCmanager and scan
1.All of the
say they cannot communicate with the scanner.
One of the problems may be >>Do I have to configure the
serial port
itself for a certain comm port as well as designate it in the
program???I
don't know.I am at a loss here.Thanks for any info you might
have

Arthur

4839. Advice on Uniden Scanners

Newsgroup: rec.radio.scanner
Date: 1998-11-15 00:00:00 UTC
From: hermit@erie.net
Message-ID: <364f4e27.25650741@news.erie.net>
Source record: 138019
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I would really appreciate any advice, comments, pro or con on the Uniden *Bearcat* brand of scanners. I am interested in purchasing a base model, and I have been looking at the BC890XLT, BC895XLT, and the BC9000XLT models. From what I can see, the main feature in the number of channels. How do these compare with the scanners sold at Radio Shack? I am not new to scanners; I have BC700A 800mHz in the house, one in my truck, and a handheld Sportcat. I am just not familiar with the larger base units. Also, if anyone has a BCT12, I would apprecate comments on that as well.

Thanks for your help.

Dick

There is an adapter for the Motorola battery that slides on in place of
the battery and is powered from the cigarette lighter plug. No need for
a regular battery. I dont recall who makes them but I have seen them.

I don't know how you would broadcast audio over a LAN without
streaming it. I suggest a point-to-point audioconferencing software,
but streaming it in RealAudio is the good choice. It only uses 6.5k
for a low-bandwidth, high-fidelity stream... check out

4853. Uniden/HP BearJet 3000-P

Newsgroup: rec.radio.scanner
Date: 1998-11-16 00:00:00 UTC
From: Radio Daze <radiologist@yahoo.com>
Message-ID: <01be118c$d8168240$LocalHost@default>
Source record: 137783

New product announcement: Uniden and Hewlett Packard have teamed up to produce this Holiday season's hottest scanner: The BearJet 3000-P. This new flatbed scanner receives all frequencies 0.5 - 2800 MHz (less cell) in 36-bit color. It's easy to set up, just plug the scanner into the computer's parallel port, plug the antenna into the scanner, then power it all up. Legal-capable scanning area of 8-1/2" by 14" in your choice of AM, NFM, WFM, CW, USB and LSB. For both Windows 95/98 and Mac. Suggested Retail Price: $279.99, plus tax.

Scanning the world, one page at a time: The BearJet 3000-P!

Available soon at Target, Osco, Rite Aid, and most larger Sears Stores. Price slightly higher in Alaska and Hawaii.

Lafayette Indiana does now. It copied some ordinance from
Wisconsin where they just took the FCC regulations and made
them a city ordinance. Now the local cops, with help from who
ever does the police radio repair (GROL), can arrest these
CBers for interfering with the good citizens. And for having
too much power, illegally modified radios and over modulating.

4859. Re: What is trunk tracking???

Newsgroup: rec.radio.scanner
Date: 1998-11-16 00:00:00 UTC
From: radio911@aol.com
Message-ID: <19981116141114.03754.00001467@ng110.aol.com>
Source record: 137789

In answer to your question, Trunktracking is the splitting of radio frequencies in the 800 mhz band into smaller "talk groups." Previously, all one needed to monitor any business or agency was their F.C.C. frequency. Now, those frequencies have been divided into hundreds of smaller groups.
The trunktracker radios accept analog trunktracker frequencies and then when a transmission is made, the i.d. of the individual user shows as a four or five digit talk group.
The "fun" in scanning (if you can call it that) is now trying to match the i.d.'s to a specific agency or business. Now, police, lifeguards, fire, school districts, investigators etc. all share a bank of frequencies and each has their own talk groups! It gets more complicated, too.
If the system is digital as opposed to analog, it is presently NOT possible to monitor their transmissions. Rumor has it that next year, a scanner will be manufactured which will receive both analog and digital broadcasts.
How do you know the type of system an agency is using? That's another chapter.
Keep watching this newsgroup - twice a month, FAQ's (yours) are answered by several postings. Happy scanning!

17: How can I modify my scanner to follow trunked systems?
18: My PRO-2004 has problems, first mild and now severe. It
has been repaired several times. Is it fixable?
19: Can my scanner be interfaced to a computer for remote
and automated control, as well as for programming of
the memory channels by the computer? Can the
interface acquire data from the scanner and send it to
the computer?
20: What's a 'discriminator output' and a 'data slicer'
21: What books have you written, generally what topics do
they cover, are they still in print, what do they cost,
and are they available to order at any web site?

==========
QUESTIONS AND ANSWERS
==========

01: How do I restore cellular in my scanner ?

Forget it, pal. It ain't going to happen. The TDDRA of 1994
(an Act of Congress) expressly forbids the manufacture or
importing into the USA of "easily modified for cellular" scanners
after April, 1994. Manufacturers were required to remove cellular
capability from the scanners' CPUs altogether. Sorry, cellular
coverage is not possible if your scanner was made or imported after
March, 1994.

But here is a list of all those pre-1994 scanners of which I am
aware that ARE capable of cellular restoration:

PRO-2004 BC-855XLT *3 Regency 4030
PRO-2005 BC-200XLT Regency 1600
PRO-2006 BC-205XLT
PRO-2022 BC-760XLT *4
PRO-2026 *2 BC-700XLTA *4
PRO-2027 BC-890XLT *4
PRO-2030 BC-950XLT
PRO-2032 BC-2500XLT *3

PRO-34
PRO-37
PRO-39
PRO-43 *1
PRO-46 *2 *5
PRO-51 *2
PRO-23 *2

Note 1: Date of Mfg code 1A4, 2A4, xA3, xA2 (label in battery compartment), or no "A" in the serial no.

Note 2: Date of mfg code 1A4, 2A4, -A3, -A2 (label on back).

Note 3: Date of mfg code must not end in the letter "D", except for OAID.

Note 4: Date of mfg code must not end in the letter "D".

Note 5: Units with date code of 5A4 can tune cellular in 30 kHz Steps using a keyboard entry sequence.

For instance, PRO-43's imported before March, 1994, are modifiable, while some brought in during March and all thereafter are impossible to modify. Date codes of any -A2 or -A3 and only 1A4 and 2A4 are assured of being modifiable. 3A4 and up probably aren't.

The above list does not include those scanners that were naturally capable of receiving the full 800 MHz band, without modification. The below list of radios had relatively continuous coverage that includes cellular:

J.I.L. SX-400 Yaesu FRG-9600 AOR-8000 *
Regency MX-4000 AOR-950 Icom R-7100 *
Regency MX-5000 AOR-1000 Icom R-1
Regency MX-7000 AOR-1500 Icom R-100
Yaesu FRG-9600 AOR-2500 Icom R-9000
Kenwood RZ-1 AOR-3000 * Icom R-7000
Uniden BC-800XLT

* pre-1994 only

Some of these radios, if still current, had the cellular removed by the factory after March, 1994. There may be possibilities of restoring cellular in later models of the AR-8000, AR-3000, and ICOM radios by replacing an EEPROM or reprogramming one, but that is beyond the scope of this FAQ, and in general, should not be considered feasible.

==========
02: What about cellular restoration ads for post 3/94 scanners?

Yes, I used to see magazine ads to "restore" cellular or to "unlock 800 MHz" in newer scanners. Gasp! This is almost a deception. See, these ads were for the "VD" mod.

Virtual Downconversion - better than a venereal disease, but not by much. To my way of thinking, it is an inferior method of "unlocking" the cellular bands because:

A. They're not really unlocked. VD is a trick of turning off one oscillator and turning on another. Typically, they set the scanner to the 400 MHz band, and then turn off the normal 400 MHz Local Oscillator and turn on the one for 800 MHz to make cellular receivable on the 400 MHz display.

B. There is no logical correlation between the actual cellular frequency and the displayed frequency. It varies from one radio to the next, but suppose 880.000 MHz comes in. It might be received/ displayed on 432.6775 MHz. Duh....??

C. The full cellular bands of 823.950-849.000 and 868.950-894.000 are not available by this method. In fact, only a small part of one or the other (often not both) is available, like maybe 10-20 MHz of the total.

D. There is no 30 kHz stepping. You're limited to the default CPU "rules" for the band in which the cellular appears, typically 5 kHz or 12.5 kHz.

E. The exact results of the VD mod, generally described above, depend on the scanner. Results vary from one to the next. None are what I'd call "good" or even acceptable.

The good thing that can be said for the VD mod is that it is the ONLY way to get any cellular at all from post March-1994 scanners. So, the advertisements that you may have seen are not exactly "fraud".....but you sure don't get much.

==========
03: Are any mods available for my scanner ?

You may have the wrong impression about scanner modifications and hacking. Mods are not "available" in the sense that they can be found on a store shelf, or laying on the top of someone's mind who can tell you in so many words or less how to turn that a Snakebite X101 scanner into a fire-breathing, rip-snorting behemoth of a TurboWhopper.

All scanners can be modified for something; generally a dozen or more things. But only a few scanners have anything written about them in detail. And you have to know where to LOOK. You can't just up and ask for "mods".

Well, you *can*, but you won't get a substantive reply.

It takes me several days to several weeks and sometimes
MONTHS to work up and write about a hotshot mod for a
decent scanner, and after THAT level of effort, it's not
possible to make it "available" off my fingertips. Continue
reading below. There are answers to your question.

==========
04: What mods do you have for my scanners?

I wish I knew what people mean by: "what mods do you have..."
I don't "have" mods, exactly.....

I wrote three books and eight years worth of the monthly WORLD
SCANNER REPORT that feature mods for a variety of scanners.
With over 900 scanners ever marketed, I don't pretend to cover
them all.....just, a fraction.

Many of "my mods" can work with most any scanner.... but there is
no way I can write explicit instructions for more than the bench
models on which I develop mods. I can and do offer hints on
how to apply these mods to other scanners but again, not having
the scanner in front of me and not having the Service Manual,
there is little I can do other than hint.

I have to leave it to the user to study the published materials
and then ask specific questions to which I am happy to provide
specific answers...if I can. That's about as good as it gets.

You are strongly encouraged to thumb through my books and through
the back and current issues of the WORLD SCANNER REPORT to see
what interests you and to pick topical material from which you
can phrase specific questions that have possibilities of reply.

As it is, all I can say at this point is that DOZENS of mods are
possible for your scanners, but I have to leave it to you to do
the legwork and research. And when you have specific questions,
then I can answer them.

==========
05: Can you send me "the mod" for my scanner?

Well, what is "the" mod? There are dozens of possible mods
for your scanner. Regardless, the answer in general is no, I
don't "send" mods. I have published hundreds of mods for various
scanners and other radios in my books; in the monthly World
Scanner Report, and some as text files on my Web and FTP sites.
You can exhaust these resources to your heart's content.

Due to the overwhelming flood of requests for this kind of
information, I can't do personal and custom research. There just
isn't time in the day for that workload. If it's free info you
want, try looking up scanner Web and FTP sites. If you don't mind
paying for better quality info, then try books and magazines.

You can also try the Usenet REC.RADIO.SCANNER newsgroup where modification information is sometimes published. It's free if you have a connection to the Internet and a Usenet reader/editor program.

==========
06: Where can I find mods for my Brand-X scanner ?

Mostly you can't. There are only a handful of scanners ever made that were worth focused research and development. Those scanners include:

PRO-2004 PRO-2005 PRO-2006 PRO-2035 PRO-2042
PRO-2022 PRO-43 PRO-34 PRO-37 BC-200XLT
PRO-26 PRO-39 BC-3000 PRO-64 PRO-2041

You can find occasional articles and files on "mods" for other scanners not mentioned above, but they are the exception to the rule. Start by looking up scanner Web and FTP sites, and peruse their quick-links to other sites:

Many scanner Web Sites have quicklinks to dozens of other sites that may contain a file or two on generic "Snakebite" scanners. But don't get your hopes up.

Now here is the problem: I am one of the few, (if not the ONLY) engineers seriously committed to scanner mods.

Yet, there are over 900 scanners on the historical list now. It is physically impossible for people like me to dedicate attention to any but a few. We have to choose among the more popular scanners, you see....certainly the ones that interest us. Now what scanners do you suppose engineers and technicians will find "interesting"? Not many, pal.... not many.

The above list of scanners reaches out to tens or hundreds of thousands of owners. There is no time left to work on generic "SnakeBite" scanners that have little to offer, even after hours of hard work! But take cheer and read on.....

==========
07: So you mean there are no mods for my scanner ?

More or less I mean that, but, that's not to say yours can't be modified. It can! It's just that there is nothing published for it; nothing in the way of step-by step instructions with graphics, photos, and details.

No one would go to the time and trouble, you see? The preponderance of published hacking information is for those scanners listed in Question 05 above. Other scanners just aren't interesting enough for professional investigation.

An engineer who is capable of designing super-hacks for that "SnakeBite" scanner isn't going to own one! Instead, he will own

one in the Question 05 list, one that is eminently capable of
some very powerful modifications in the first place.

Now I said your "SnakeBite" can be hacked. It can.

But you are more or less on your own in the sense that you can't
be directed to a "shopping list" of mods from which you can pick
and choose. There is no such list. Any hope for you is to first
figure out what you want to do, and ask specific questions.

I can give you a few answers in advance:

No.

No, your scanner is likely not capable of cellular; scanners made
or imported after March, 1994, are not cellular-capable. Most scanners
are not likely to be capable of extra memory; additional frequency
coverage; and things of that nature that pretty much require factory
design in the first place. (See ahead for Memory Modifications)

Yes.

Yes, your "SnakeBite" may be capable of certain mods, a few
of which include the following: (You wanted a list?)

1. Tape Recorder Jack
2. Automatic Tape Recorder Switch (beats VOX!)
3. Extended Delay
4. Tone Decoder-Rejector Countermeasure
5. CTCSS mod
6. S-Meter
7. Scanner-to-Shortwave Interface
8. Carrier-On-Indicator
9. Audio Improvements
10. Beep volume or disable
11. Squelch Improvements
12. Remote Controller
13. Discriminator output for data decoding
See Question 18 - this can be done to all scanners
14. Event or "hit" Counter
15. Shielding of plastic cases
16. External DC power
17. Improved Adjacent Channel Rejection
18. Speed up of SCAN & SEARCH modes
19. Back light modifications

Then, maybe...depending....on the scanner.... the following
digital and/or esoteric enhancements.....???

20. Interfacing to a computer
21. Subsidiary Carrier (SCA)
22. Extended Memory to 25,600-channels & up
23. 54-88 MHz restoration

24. Data/Tone/Noise Rejection
25. Trunk "Tracking" - maybe.
25. Cellular restoration (See Question 01)

==========
08: So how can I do some of these mods?

That's a problem. No one has written them up for any but a few scanners. About the only way I can think of is to get one or more of my three books and a subscription to the WORLD SCANNER REPORT. Research and study up on the mods we've developed for other scanners, and then compare the procedures for that specific scanner to yours. Often, when I write up a mod, I give hints on how to apply it to other scanners.

Also, if you ask me *specific* questions, I can give specific answers. If you ask "how to do a memory mod", I'll have to refer you to something already in print or published somewhere. If you are doing a memory mod and run into trouble, then I can help you with that trouble.

==========
09: Memory mods? How can I increase the programmable channels?

That depends on what kind of memory storage is used by your scanner. There are three kinds:

1. On-board CPU RAM (Random Access Memory)
2. Static Random Access Memory (SRAM)
3. EEPROM Electrically Erasable Programmable Read Only Memory.

The first kind is most prevalent and there is no way to expand that kind of memory. It is, however, usually limited to scanners with 50 channels or less of programmable memory. 100-channels and up are usually done by methods 2 or 3. So your first step is to determine what kind of memory is used by your scanner.

EEPROM memory is expandable, but very difficult under most circumstances. SRAM is the easiest and offers the largest expansion capabilities. For example, the PRO-2004, PRO-2005, and PRO-2006 can be expanded to 25,600 programmable channels (and more)! The PRO-32, PRO-34, PRO-37, PRO-39 & PRO-2022 can go to 12,800- channels and beyond. The BC-760XLT, BC-560XLT, and a few others can be taken to 6,400 channels and more. The PRO-2035 and PRO-2042 can be taken to 16,000 channels and beyond. The PRO-2041 and PRO-64 are good for upwards of 25,600 channels.....

My Extended Memory Modifications are amply documented in excruciating detail in my books and in the WORLD SCANNER REPORT, complete with diagrams, photos, and many pages of instructions such that most casual hobbyists who know a soldering iron from a tire iron can do the work. This kind of mod is not suited to being given out in an e-mail or a forum message in so many words

or less. You will need to acquire the instructions before doing the work.

==========
10: How do I tell a SRAM chip from an EEPROM from CPU RAM?

If you can't do this on your own or after the below explanation, you are probably not a candidate for such a wild adventure at this stage of your hacking career.

Most CPUs hold a small amount of RAM (random-access- memory), sufficient to store anywhere from 10 to 50, maybe a hundred channels or so. This is the case for most scanners, so there is no way to increase that memory. Fortunately, there are two other methods of RAM used by a few scanners that offer possibilities for expansion.

EEPROM: The least common and least expansive is EEPROM (electrically erasable programmable read-only-memory). The PRO-43, PRO-26, BC-2500XLT, BC-200XLT, BC-100XLT and BC-3000XLT, for example, use EEPROM programmable memory. It is possible to expand EEPROM-types of memory, though not by such huge proportions as the SRAM type. EEPROMs are usually tiny little chips with 8-pins.

SRAM: A handful of scanners use a separate SRAM (static random-access-memory) chip for storage of frequencies and custom channel settings. It is this type of memory that can be easily and economically expanded by factors of 2, 4, 8, 16 and even 64 times the original volume! Scanners known to employ SRAM memory include the following:

PRO-2004 PRO-2021 PRO-32 BC-760XLT
PRO-2005 PRO-2022 PRO-34 BC-950XLT
PRO-2006 PRO-2032 PRO-37 BC-590XLT
PRO-2035 PRO-2041 PRO-39 BC-600XLT
PRO-2042 PRO-64

There may well be other scanners that use SRAM memory, but either I forgot about them or don't know. If you're curious about your scanner's potential for memory expansion, you can just about forget it for those with fewer than 100-channels. The CPU's RAM easily handles 10 to 100 channels or so. If your scanner is not on the above list, but has 50 or more channels, then look over its schematic diagram and parts list or scrutinize its Logic/CPU Board for any of the following types of SRAM chips:

uPD446G-15 TC-5517CF-20 LC-3517BM-15
CXK5864BP MB-8416-20LPF BR6265BF HY6264

or something similar, disregarding the last few digits and letters. An SRAM chip is generally characterized by a rectangular shape with 24 to 32 pins, each of the longest sides holding half

the pins. An SRAM chip in a schematic diagram will be characterized by eighteen or more of its pins going straight to the CPU chip. Any chip with less than 24-pins is not likely to be an SRAM; neither is any chip in a square format. SRAMs are rectangular (DIP or SMT) with 24 to 32 pins. Pinout notations of SRAM chips will include mystic codes such as:

A0, A1...A9, R/W, CE, I01, I02...I08, OE, etc.

==========
11: My scanner has an SRAM; how do I do the mod?

Get the published instructions for Extended Memory Mods. These instructions are much too detailed to include as basic text files, and in most cases, the articles are copyrighted anyway. Start by reviewing my free Table of Contents and Index to the World Scanner Report where you will find articles on memory mods. Get at least one of my books to supplement the WORLD SCANNER REPORT. The ULTIMATE SCANNER book is a good choice.

The Table of Contents and Index to the World Scanner Report can be found on my Web and FTP sites. They're also contained in my product information file: PRODINFO.ZIP

I can send these files by e-mail upon request, or they can be downloaded from my Web and FTP sites.

Since all SRAM chips are much alike, my instructions for one scanner generally apply to all, and are not too difficult to follow, provided you can find the SRAM chip in the first place.

==========
12: Do you do scanner modifications like memory mods?

Sure. Contact me privately and we can go from there. One note, though: I don't do cellular mods anymore. The FCC has gotten persnickety about that sort of thing. In general, I don't do speedup mods anymore because they cause more problems than the speed increase is worth.

==========
13: I'm not interested in all your mods - just one. Will you photocopy the information for me?

Not if it's in a copyrighted publication. My publishers own the copyrights to my books and my company owns the copyrights to material published in the World Scanner Report. It would be unethical, illegal, or both, for me to make copies.

If your budget is tight, you can in many cases get basic information for free from Web and FTP sites. The real good stuff generally comes only in books, magazines, newsletters, and such, like Popular Communications, Monitoring Times and the World Scanner Report. It is not always necessary to buy information

in order to do mods. On the other hand, the published mods are NOT the low degree sort of thing you find on BBS's and Internet sites with a few sentences or paragraphs and maybe an ASCII drawing if you're lucky.

My mods are detailed and well documented with graphics, including schematic diagrams, photos, and illustrations. This kind of work can't come for free, though.

On the other hand, there may be no cost if all you want are the simple mods like the cellular mod to the PRO-2006.

==========
14: So how do I restore cellular in the PRO-2006?

1. Remove the top cover of the scanner.

2. Look down inside the front panel behind the #3 key of the keyboard, and clip the exposed leads of the two coppery colored diodes standing on end. One restores cellular and the other gives a FREE 25% speedup of the SCAN function.

3. Replace top cover.

See, that's the kind of stuff that comes for free.

==========
15: How can I install the military aero band in my scanner?

You can't, and that's that. If your scanner didn't come with the military aero band (220-400 MHz), then there is no way under the sun of "restoring" it. You can't restore what ain't there.

==========
16: How can I modify my scanner to follow trunked systems?

You can't, not exactly. Each trunked system is as different as night and day with respect to other trunked systems, even from the same vendor.

It is possible for the hobbyist to gain some skill and fortitude in following trunked system conversations. These techniques are scattered around in various written works, from books, magazine articles, and prefaces in frequency directories...to text files on various BBS's and Internet archives. These techniques, hints, tips, and kinks cannot be recited here in so many words or less. One good starting point might be the preface material in any recent edition of Radio Shack's POLICE CALL books. But in a word, you cannot alter your scanner to follow trunked signals.

Uniden's and Radio Shack's TrunkTracker series of scanners are specifically designed to follow Motorola trunking systems.

There is some interesting software appearing around the Internet these days....that may be useful in trunk following. Check out

these web sites for interesting possibilities if you don't want to cough up for a Uniden TrunkTracker:

http://web2.airmail.net/lblant1/dfw/digital.htm
http://www.geocities.com/CapeCanaveral/Lab/1060/beta.htm

See Question 18 for more info on this possibility.

==========
17: Can my scanner be interfaced to a computer for remote and automated control, as well as for programming of the memory channels by the computer? Can the interface acquire data from the scanner and send it to the computer?

In a word, yes. Many scanners "can" be interfaced to a computer for one-way control and automated programming of the memory channels. These scanners include:

PRO-2004 PRO-2005 PRO-2006 PRO-2035 PRO-2042 PRO-2041
PRO-2022 PRO-34 PRO-37 PRO-39 PRO-43 PRO-26
PRO-64

Probably quite a few others are possible - most, really.

There are three scanners that are capable not only of the one-way mode of remote control and automated programming, but also of a "data acquisition" mode where the scanner sends its display (channel, freq, bank, mode, delay, lockout) and other data to the computer for automated logging and data processing. These scanners are the PRO-2004, PRO-2005, and PRO-2006.

Several companies make scanner/computer interfaces, including Optoelectronics and COMMtronics Engineering.

Each interface has its own unique characteristics, advantages, and limitations, but all are "good" in the sense of freeing the operator from much of the labor and drudgery of scanning. The Optoelectronics interfaces are generally limited to the PRO-2005/6 & PRO-2035/2042.

A "roll your own" computer interface was published in the World Scanner Report, V2N1-V2N6. Another more powerful one was published in my 3rd book, THE ULTIMATE SCANNER (Cheek3).

COMMtronics Engineering's CE-232 Scanner/Computer Interface is in its fifth year and continues to be a front-runner and state of the art. For more info:

http://ourworld.compuserve.com/homepages/bcheek/

ftp://ftp.cts.com/pub/bcheek/ce-232

John Montalbano KA2PYJ, seems to have designed a nice one-way interface and control software. I can't vouch for it, but go to the following URL and see for yourself.

http://www.qsl.net/ka2pyj/

==========
18: What's a 'discriminator output' and a 'data slicer'

Ahhh, I'm glad you asked. This one is hotter'n a $2 pistol these days. For gory details, including detailed instructions on how to take advantage of this hot, new interest, see my file or regularly posted newsgroup article with the SUBJECT:

"Scanner Data Decoder FAQ" SCANDATA.FAQ

DISCRIMINATOR OUTPUT
==========

But to answer your question in so many words or less, every scanner has a Discriminator, a circuit usually little more than a chip, the purpose of which is to detect narrow band FM (NFM) signals. NFM is the mode most commonly used above 30 MHz, whether for voice or data transmissions. Regardless, if it's an NFM signal of any type, the Discriminator converts that signal into audio. It's low-level audio, but nevertheless audio.

If it's a voice signal, you'll hear and understand it as this signal out of the Discriminator gets filtered and amplified up to speaker volume levels. If it's a data signal, well you'll hear that, too, but you won't understand it. Data signals are raucous, nasty sounds that'll send you scrambling to hit the SCAN or arrow keys mighty quick.

BASEBAND AUDIO
==========

Unless, of course, decoding that data is among your interests. If it is, then there are a couple more things you need to know. First, this Discriminator Output signal is also known as the "baseband audio". The chief characteristics of the baseband audio are (1) low level, typically .2-.8 volts, AC), and (2) unfiltered.

Unfiltered? Well, yes. See, the human voice band is considered to be 300 Hz - 3000 Hz. Signals above and below that range are not considered essential to the successful transmission of voice, so to simplify the design of the audio preamplifier and power amplifier in the receiver, and to cut down on noise and hash, cheap and simple filters are used to eliminate signals below and above that band. And for voice, it's no big deal. All communications receivers, including scanners have some kind of voice band filtering between the output of the detector/discriminator and the headphones or speaker.

DECODING DIGITAL DATA
==========

Trouble is....data signals, especially high speed data above
2400-bits/sec (bps), have a bandwidth somewhat wider than the voice
band. This simply means that you cannot successfully decode high
speed data by tapping the signal off the speaker or headphone jacks.
You have to take the signal for decoding right off the output of the
Discriminator. Therefore, since decoding data is getting to be
interesting and of wide appeal these days, you'll hear a lot of talk
about "discriminator outputs" and "baseband audio taps"; one and the
same thing.

DATA SLICERS or DECODER INTERFACES
==================================

Last, but not least, in order to decode data signals, you need a bit
of extra hardware and some software. The software is more fully
discussed in my regular article titled SCANNER DISCRIMINATOR DATA.
The extra bit of hardware that's needed is referred to as a "data
slicer" or, as I call it, a "Data Decoder Interface".

The Input of this decoder interface or data slicer is fed from the
scanner's Discriminator Output. The Output of the decoder interface
goes straight to one of the computer's COM or serial ports. Fire up
the computer and the software; turn on the scanner and tune in a
data channel, and you're in business.

For a circuit diagram and construction details, as well as how to
identify and locate the Discriminator in your scanner, see my
regular newsgroup article titled SCANNER DATA DECODER FAQ. That'll
get you started on the cool, neat, fun world of decoding digital
data off the airwaves. You can also get the file from my FTP site
at: ftp://ftp.cts.com/pub/bcheek/faqs/scandata.faq

21: What books have you written, generally what topics do
they cover, are they still in print, what do they cost,
and are they available to order at any web site?

In article <72odr9$saf@sjx-ixn5.ix.netcom.com>, liberty6@ix.netcom.com says...
> Does anyone know the frequencies that police use with their mobile-computers? If so, what is the speed of their packets? Also, are their transmissions scrambled?
> Any info would be appreciated!
>
Generally they are in the 800 MHz area. I have listing I can lookup for MDT frequencies in the Golden Gate area of California (Santa Clara, San Mateo, Alameda, Contra Costa, San Francisco, Marin, Solano, Sonoma and Napa Counties) My source lists just about all public safety freqs (input and output freqs and CTCSS or DCS if applicable.) I bought this info so I don't really feel I should give it away to everyone, but if anyone has any questions, I'll look it up.

Sir, your previous post said you would like to stay under or around
$300.
Your not going to get a decent scanner to eliminate unwanted noise like
that. I suggest dipping in a little more and get a scanner with a PL
board and enter the privacy codes for the departments you listen to.

Rupert Ramirez <warrior5@gte.net> writes:
>Frequency stability is tight as well -- transmitters must not drift more
>than plus or minus about 500 Hz (.00025%). You'll find typical ham
>radios on UHF up to 1000 Hz off frequency.

These numbers don't agree with each other. .00025% is 2.5 PPM tolerance,
which makes some sense - amateur UHF transceivers are often specified
at 5 PPM. But 2.5 PPM error at 462 MHz is +- 1155 Hz, not +- 5 Hz.
And ham radios with 5 PPM error can be 2250 Hz off at 450 MHz.

Another data point: the data sheet for the Icom IC-4008A specifies its
frequency stability as +- 1.7 kHz, which is about 3.7 PPM error.

I don't know what the "official" spec is.

Dave

OK Ron, There are numerous posters that have paid for information and share it with there fellow scanner enthusiasts. I understand where your coming from - I paid for why should I just give it way. With all the FREE advise and FREE information being sharred here you might think about that. How much information and advise have you gathered from the generosity of the posters here?

What ever, YOU have a positive day.

PS: I don't need the information, the police in my area don't use vehicle computers, yet.

I have a Radio Shack Pro-43 handheld scanner for sale.

Here are the details:

- good to very good condition
- the diode has been moved giving it 870-890 MHz and 51-88 MHz coverage
- no other mods done
- original rubber duck antenna
- manual
- everything on the radio works - never had any problems

I would like $225
If interested please e-mail me for more information.

Thanks,
Joey

I travel I-10 between Phoenix and Southern California on a regular basis (every week) I have frequencies for Central Arizona but not for la paz county.

On I-10 in Arizona, I search 460.0-461.0. Once i cross into California I search 42.0-43.0. The Riverside Sheriff and some other Riverside cities use 866-869mhz trunked frequencies as do San Bernardino county and some San Bernardino county Cities. In Palm Springs, and also Orange County they use the same frequencies that are used in Maricopa County (460-460.5 mhz)

In Los Angeles county, there are 483, 488, 506, 507, 508, as wel as 470 mhz frequencies in addition to the 154mhz, 453mhz, and 460mhz frequencies.

will trade my list for yours!!

JOHN

==========
900 MHZ BAND FREQUENCIES

Many of today's 900 MHz cordless telephones offer digital encryption
or spread spectrum technology. Either of these systems will render
the reception of the conversation by an ordinary scanner impossible.

Taken From Panasonic KX-T9000 60 Channel Model

Base: 902.100 - 903.870 Base frequencies
Handset: 926.100 - 927.870 Handset frequencies

>EDACS!

Yup, I have the full blown 456 board in mine and use Probe 4.0....it cooks! I understand the full-blown 456 board is no longer being manufactured because the decoding chip is no longer being produced, so if you don't care about tone decoding, then the 456 lite would be a great choice. Probe 4.0 is the best software I've used for my 456 board. I met Perry at the Dayton hamvention last year, and he is a great guy and very supportive of his software. It is a great piece of work and will give you virtually unlimited channel capacity. It is a DOS program, but works fine in a DOS window under '95/'98. Many people dedicate an old 286/386 strictly to the scanner. All you need is a computer with a functioning serial port. The 456 board is a piece of cake to install...took me about an hour. If you can use a screwdriver and aren't afraid to pull a few connectors loose inside the scanner, then you should have no problems t'all. If you're horrified popping the covers on your scanner, any competent service tech can do it for you easily.

BTW, Jack, can you tell me where I can find some freebee or demo software that will do the tracking? Much appreciated!

Dan

I had a pro91 for several days and then returned it and got a pro-90
instead. The pro91 is a wonderful radio, but the cannels were not
enough for me. It has a wonderfull display, and great sound quality.
If you don't mind the less channels, its the way 2 go.

Well I think you should get your facts straight before making an ass of yourself with groundless insinuations as to my reputation. I use this email address so I don't clog my personla email address. And so I don't get spam mail at my personal email address - which happens frequently when you post on newsgroups. Also, nowhere does it say you must send me the money first. There are CODs. There is meeting in person. Sad you are so prejudice.

They jumped the gun on the Feingold Amendment which never
became law -- it passed the Senate and was stalled in the
House (my original info that it cleared the House was wrong).
It was attached to the McCain Anti-Slamming Bill but it didn't
make it out in time. Whew!! Close call....

The situation as I know it from a source in that area was that
a CBer was getting into a neighbor's telephone (power level
unknown), and the CB operator offered to buy her a bullet-proof
phone. This was rejected and the wheels started turning. I
have yet to see the actual ordinance but it allegedly covered
only overpower and out-of-band CB, the same stuff that the
Feingold Amendment would have covered.

As it stands, Lafayette (or anywhere else) has no authority to
enforce CB rules. There is a specific U S Court of Appeals
ruling that is very clear that the FCC has exclusive
jurisdiction over cases of interference to home electronis
equipment.

Let's see if we can keep it that way.

My offer stll stands.

Actually, I would like to see local police jurisdictions have the ability
to enforce a limited set of FCC regulations, mostly specific CB and amateur
regulations. When enforcement is not taken it only creates an atmosphere
of "who cares" among individuals disinclined to obey the FCC regs.

I'm using Probe 4.0 also but with a PRO-2042 and an OS535
board. You're right about the chips no longer being produced.
Only the OS456 Lite is available for the 2004/5/6 models
through Optoelectronics. Tone decoding is nice but the other
thing you lose with the Lite board, from what I've been told, is
the signal strength meter. Probe shows a relative signal strength
by using the interface. Shame that's gone. Nice feature for
fine tuning your antenna.

I just bought a 486 DX-50 computer through ebay for $84. Got
it today and connected my scanner and Probe software. It
is still able to scan at ~60 channels/second, as it did when
connected to my Pentium 133 MHz machine. Slick! Now I
a dedicated computer for my scanner. :-)

I clipped the two diodes referred to in the common modification
for the PRO-2006, and did the reset procedure (several dozen
times) using both the rear panel and front panel reset buttons,
but it still doesn't have expanded frequency coverage. Does
there exist a "new" model that the modification won't work on?
If so, does anyone know the serial number range, or how to
identify -which- models won't respond to the "diode clip" mod?
Is there a "workaround" for the PRO-2006's that won't respond
to the diode clipping? Any info would be appreciated. Please
respond direct to my e-mail address-> kr4wm@bigfoot.com .
The e-mail address in the header has SPAM protection, so
please don't hit "REPLY", it won't work unless you remove

I certainly hope you don't mean me. Having fought with a recalcitrant FCC
over enforcement laxity I think I speak with a certain amount of authority.
Add in my QCWA membership, DXCC and local club presidency, field day
chairmanship and technical committee member I figure I got as much right as
the next feller to say something about the need for local authority to
tackle some of the easier interference problems.

That is precisely the area that local officials should NOT have any
authority. They have not the expertise to measure if an amateur rig is
broadcasting spurious RF or not and if it exceeded that rigs accepted
ratings. Your problem was buying poorly designed consummer electronics.
For all you know the ham was operating within his rights and you violated
the law by interferring with his operation.

The only areas should be for local authority, as an example, to track down
key-down interference traced to a location or perhaps excessive CB power
useage. Usually the non-technical, anyone can figure it out, type of
violations. Don't forget in any criminal proceeding the prosecution must
demonstrate that a violation of law occured. That means a competent
witness to testify to the illegality of the operation. The more
sophisticated RF crimes are generally beyond the ability or desire of most
police agencies.

I drive Interstate 10 between Phoenix and Southern California onm a regular basis. I carry two AOR scanners and a CB with me so I can get traffic and other information along the route.

In Arizona, I search 460.0-461.0. As i get close to California, I search 42.0-43.0 or I monitor 42.44. This is the CHP frequency used between Blythe and Beaumont.

I do not have any La Paz or Yuma County frequencies. Anyone have frequencies forthe county or any town in this area?

The Riverside and San Bernardino County Sheriff and many cities here use a system that is in the 866-869mhz range. Palm Springs uses 460.1 which is the same as one of the Maricopa County (Phoenix area) Sheriff's frequencies.

The railroad frequencies are also interesting. Between Palm Springs and Los Angeles these can be quite busy. There ae large rail yards in the Ontario and San Bernardino areas as well as several in the Los Angeles and Long Beach areas.

JOHN

In Los angeles County, the LA Sheriff uses 483 and 486mhz frequencies. You also find several 470, 508, and 509mhz frequencies in use. Los Angeles Police is on 506, 507, and 508mhz frequencies..

Generally frequencies between 470 and 512 are not used except in a few exceptional areas.
Los Angeles, San Francisco, and New York are a few of these.

Steve,

This Bug's for You, Part I has this glitch in it:

"I've rewritten this paragraph several times. Each time I take a
broader view, because I don't want to sound too cynical. I will
say this: Don't be worried about the $25 "surveillance" transmitters
marketed extensively to Walter Mitty. Same goes for
wireless mikes and the whole series>

Transfer interrupted!

ghtest sound" over some fantastic range. All of these devices drift,
have power outputs in the single digit milliwatt range (a
milliwatt is 1/1000 of a watt), and generally will not penetrate the
first wall. Maybe you could get the claimed quarter mile"

and I thought you may care to look into the problem for us.

I've gotten the Part II, but would appreciate your emailing me the
corrected Part I if you will.

I reposted this under this title since I realized the other title made it sound like I was asking where to buy a scanner in my area.

I live in NYC, but not in Manhattan, I live in Queens, in a residential area. I'm not sure if this would be considered a congested area. I was thinking of getting the Yupiteru 7100 but don't know if I will have problems with it here since the Yupiteru can have interference problems. If it's a problem I was considering getting a Uniden bc3000 or something else, can anyone tell me if the Yupiteru would give me problems here or what would be the best for me under $300.

Source record: 137845

I don't know if the Yupiter 7100 has something else that's special to it's reception abilities, but would buying a different scanner that maybe isn't as sensitive as the Yupiter and adding an antenna to it give you the same results? I've heard the Yupiter can have problems with interference, that's why I ask. When I say adding an antenna to a different scanner, I don't mean adding an antenna to any cheap scanner, just a different good one. My thinking is if you could do this, you can also benefit from some of the extra features some of the other scanners have.

>Charles
>
>To reply, remove the "x" from my address

Charles,

This applies to the PRO-2066 and the BC235, not the BC895. On the 895 you will use one of the other buttons, I think it's the DATA key. However, that appiles only to those radios which have had the mod incorporated in their firmware. So far I beleive only the 2066 has it.

Why doesn't the 895 have a SVC button? I don't know. They didn't consult me on stuff like that. To give you an idea of where I stand in the Uniden scheme of things: At one point I complained that a proposed Trunktracker's layout was not very attractive. When the person in charge of the product heard about this his response was simply, "Who cares what he thinks."

Not at all! From my FAQ:

8. I've heard that you can monitor pagers with the computer and
scanner, how can something this cool be possible?

You will want to pay a visit over to:
http://www.geocities.com/CapeCanaveral/Launchpad/4039/
http://aab.42.org/poc32/
http://www.geocities.com/SiliconValley/Network/8916/digital.html

The interface can be built for about $5 at radioshack!

For top of the line attache's for portable computers, etc. go visit ZERO Halliburton at http://www.zerohalliburton.com and have a look.

They are definitely not cheap, but they are the best, IMHO. If you care to compare prices call ZERO and get an MSRP price for a given model attache, call some local luggage stores, then visit http://www.worldtraveler.com and call their 800 number for pricing. Huge discounts. I've bought two ZEROs through them. And NO, I don't have any affiliation with either company, for the record.

Take it easy,

4921. AOR AR-8200 Processor noise reduction

Newsgroup: rec.radio.scanner
Date: 1998-11-16 00:00:00 UTC
From: F a b r i z i o <AvStrien@usa.net>
Message-ID: <72p7p1$4ja$1@newnews.nl.uu.net>
Source record: 137857

Hi y'all,

A few weeks ago I posted here information on
mechanical improvements of AOR AR-8200
(you may search DEJANEWS if you missed it),
here comes a post with a processor noise
reduction tip:

I inserted a metal foil inside the scanner,
and it sure helps!I took following steps:

1) Open the scanner (7 black phillips screws),
eventually force the case to open by inserting
a knife or small screw driver in the rim to the
left of the keylock button, as well as one in the
rim near the strap eye.

2) Cut a piece of aluminium foil which will
fit inside the scanner (to be placed on the
scanner part which holds the keyboard), from
the screws at the lower end of the logic board
and the screw holes that hold the screws from
the battery compartment when the case is closed)
up to and including the folded metal strip on
top (which, when the case closes, connects to
the BNC base case).

3) Wrap this aluminium foil in thin plastic,
closing the plastic with invisible tape, but
leave small parts of the aluminium foilunisolated:
- the place of the bottom screws of the print
- the place of the battery case screws
- the place of the screw which closesd the
copper plate across the central processor
- the place of the folded metal strip making
ground contact to the BNC base case

4) Remove, and re-insert through the foil, 3
screws (2 at the bottom of the logic board,
1 at the edge of the red copper plate)

5) Fold the aluminium foil carefully to cover
the logic board as much as possible,
especially near the place where the red
copper plate (insufficiently) covers the
processor

6) Reassemble the scanner (exact positioning
of the 2 halves is required near the strap
eye, and note that the accessories cover
is still in place). This will drive the
screws inside the battery case though the
just inserted aluminium foil, and hence
increase the number of ground contacts to it.

When I finished performing these steps I noted
significant reduction in processor hiss. The
noticeable difference in background noise
during normal operation and during power-off
had totally gone.

BTW: I do not know how the first batch of 8200's
looked like (with respext to their inner layout)
but I expect this change to be possible to those
as well.

Hope that this cheap upgrade makes the AOR-8200
more popular than it already is.

Good luck 'n brgds! Fabrizio

>>>>NYC police are not trunked(except MAYBE Port Authority).
Same with fire and most(if not all) EMS frequencies.
Main trunked systems in NYC are the NY Municipal trunked system(mostly
stuff that is not terribly interesting to most scanner listeners(of
course, YMMV)).
This is a Motorola system-the Trunk Tracker will work on it.
The NYC MTA buses(but NOT the subway trains) are trunked-Motorola too.
The only other trunked system worth mentioning is the Pprt Authority
one-this is a Ericson system-the trunk trackers can NOT follow this.

In general, for NYC listening, Trunk Trackers are not terribly useful.<<<<

I can only think of one NYC agency that use trunk and could be important when
it hits the fan, that is OEM. But so far I have not heard of anything useful or
interesting and rather listen to PD.

From: F a b r i z i o <AvStrien@usa.net>
Message-ID: <72paqikfi1@newnews.nl.uu.net>
Source record: 137860

Hi, Yupiteru has, for its class, the world's most extended scanning capabilities. It allows you to select any bank with 100 memories to be scanned, up to 4 such banks to be scanned in sequence, or all 10 memory banks (that is, a full 1000 channels) to be scanned.

And when I say 'scanned', it means you may select a regular scan (i.e. all channels not locked out, a specific mode scan (e.g. only FM, or only USB channels), or a selected channel scan (you may assign up to 10 channels per bank a tag 'selected'). Each of these can be combined with the previously mentioned 1/2/3/4/10 bank scan.

Each channel can have its own receive mode, step size, lock out status (as opposed to Bearcat and Realistic which force you to use what they think is the appropriate receive mode and step size).

Yupiteru also has Wide FM (broadcast and TV audio) mode, full (eventually cell blocked) coverage from Long/Medium/Short Wave up to 1350 Mhz, it actually covers all broadcast and TV which is also rather unique in this price class.

You cannot only use an MVT-7100 for scanning programmed frequencies, you can also use it to search 10 (user defined) bands in any mode and step, or search starting at the current VFO frequency.

For these searches you may define an abundant 500 frequencies that you do not want to listen to (skip frequencies), which are stored APART from the 1000 memory channels (this as opposed to iCOM scanners which all store SKIP frequencies in regular memory locations thus reducing space for regular channels).

Finally, I'd like to emphasize that Yupiteru's run on regular NiCads or Alkalines, not on dedicated battery packs.

The one and only drawback of Yupiteru, when compared with the twin turbo devices from Uniden Bearcat is that these twin turbo scanners can (depending on various conditions) up to a maximum of 100 channels per second where Yupi only scores some 30.

What else might you want but a Yupi?

Brgds, Fabrizio

words to the same newsgroups time and again, without having to ask yet
again.

From: Jason Reilly <jreilly@tassie.net.au>
Newsgroups: rec.radio.scanner,aus.radio.scanner,alt.radio.scanner.uk,alt.radio.scanner
Subject: Definitive answer:MVT7100 discrim output
Date: Mon, 06 Apr 1998 06:39:28 +1000
Organization: Tasmania's Access Server Pty Ltd
Message-ID: <3527EC00.42FE9D19@tassie.net.au>

Hi all,
After much of the weekend looking for the real discriminator output on
the Yupiteru MVT7100 receiver, I have the following to offer.
The discriminator output (for Narrow FM) appears on pin 9 of the TA
31136 sufrace mount chip on the IF board. However the output level of
this is pretty high, and I have found that my Hamcomm slicer interface
works well (and this is probably recommended) if you tap the
discriminator not at this point, but on the other side of the 56k
surface mount resistor which takes the unde-emphasised audio to pin 8 of
the 4066 surface mount IC.
If your slicer interface does not like the lower level, I guess you
could take the high level output, but make sure you use some form of
protection against shorting, such as a 5K ohm bleed resistor.
Now, some interesting things: This point that I mentioned here works
perfectly for PD (pager Decoder etc) but I really wanted it to look at
an EDACS control channel, 9600 bps, which it did not do initially.
Switching the radio to AM mode worked! I have one theory on this: the
output that I describe is constantly on, but selecting different modes
alters the bandwidth, with AM selected over FM seeming to give a
slightly wider bandwidth, which helps in decoding fast datastreams. The
damned thing even worked when selecting SSB (work that out!) but no

output is detected for wide-FM.
So, there you have it. If your discriminator tap doesn't work using this info, try bleeding off a higher level output, and try selecting AM mode.
Thanks - Jason

I am shopping for someone that can hook up a pocsag decoder to the discriminator output of my PRO2006. The os/456 board is installed in the radio, and I would rather not preclude the use of the os456 by hooking into the discriminator output.

If anyone cares to describe their experience with interfaces and software as far as reliability and accuracy, I would appreciate it.

20db is correct and even more.
The reason it made no difference on the tv antenna connected to the tv is tv signals are transmitted both vert. & horz. polorizations to maximize range.

You may have noticed during some storms your signal seams weaker to your tv, this happens when a storm cloud is highly charged. The tv signal is being bounced off the clouds the vert signal is changing to a horz signal because of the bounce off the cloud but most of the time the horz signal will not change polorizations due to the charge in the clouds being mostly a vertical eletrical charge,so with all the tv signal reaching your tv antenna being vert polorization and your antenna being horz polorized you get a 20 db reduction in signal just from the polorization difference , there are also other factors involved but that would take a day or two to explain. If you mounted two tv antennas one vert. and one horz. you would not experience this problem during the next storm.

Notoriously enough, there was a run of 2004's
that had poor soldering on the pc boards...

Your best bet is to dismantle the radios and re-sweat
all solder connections...or better yet, use solder wick
or a vacuum to remove the old solder, clean up the
residue then resolder the joints. Be sure you don't miss any !

I was under the impression the analogue network was being broken up and
sold off to provide a cheap data transmission service for radio modems
and other telemetry 'stuff'. Surely a whole load of pay as you go mobiles
isn't going to help this.

These units are notorious for having cold solder joints. Go through
and resolder any that look funny..and a few that don't. Eventually you
will hit the problem.

4949. PRO-2026 ANTENNA HELP

Newsgroup: rec.radio.scanner
Date: 1998-11-16 00:00:00 UTC
From: Robert Dubenezic <rdubenezic@worldnet.att.net>
Message-ID: <72nqte$qi7@bgtnsc01.worldnet.att.net>
Source record: 137903

I am using a Radio Shack Pro-2026 scanner. For an antenna I am using an Larsen NMO-150 mobile radio antenna attached to an "L-Bracket". The cable is RG-58/U with a Motorola "M-Mount" on one end, and a PL-259 on the other. The "L-Bracket" is screwed into aluminum sheet near the roof line on my house.

My question is, when I listen to local frequencies I hear a sort of hissing in the backround. I checked the cable and the adapters and everything checks out. When I first set this up the frequencies came in crystal clear, now I get a kinda hissing.

Is there anyrthing I can do to eliminate this noise???

Thanks,

Bob

Yikes! This scared me! Might be ok if you already had all of this
stuff mentioned...but if you have a 2005 or 2006 and want all the cool
benefits of the trunker.exe program it would seem much more cost
effective to me to just get an OS456lite board for $100 from
www.optoelectronics.com -and any old scanner that covers 800/900mhz.
(I've seen these for as little as $20 at the pawn shop)
Next all you have to do is build a $5 interface. (Details at my
website..url below) and you are done! Wham-bam, $125 you can now
follow 400/800/900mhz trunked systems and also EDACS! + you can
identify individual units! It is very cool when the Sheriffs office
helo is up, you can easily jump to the talkgroup they are using!
If you have a 2004, looks like the other way is for you!

You can still listen to a trunked system, but it might be heard to follow conversations that keep switching channels. If your main intent is to listen to a trunked system, get a trunk tracker. If not, set a bank aside and put in a few of the trunked channels and hope that the conversations don't move from channel-to-channel to much.

The date code for most Radio Shack scanners is on the back of the unit. It should be just under the serial number.

: If I don't get a trunk tracking scanner does this mean I won't be able
: to follow conversations of Fire/Police/Ambulance, etc. with a regular
: scanner? I live in NYC, what will I be able to hear and not hear?

NYC police are not trunked(except MAYBE Port Authority).
Same with fire and most(if not all) EMS frequencies.
Main trunked systems in NYC are the NY Municipal trunked system(mostly
stuff that is not terribly interesting to most scanner listeners(of
course, YMMV)).
This is a Motorola system-the Trunk Tracker will work on it.
The NYC MTA buses(but NOT the subway trains) are trunked-Motorola too.
The only other trunked system worth mentioning is the Pprt Authority
one-this is a Ericson system-the trunk trackers can NOT follow this.

In general, for NYC listening, Trunk Trackers are not terribly useful.

There isn't much there to listen to except the audio for TV,
& it is much wider bandwidth than what would be useful.

A good way to go would be the OS456lite for $100 at
www.optoelectronics.com It is a piece of cake to install.
They might even install it..but it is very easy!
Add in the Probe4.0 software offer from inside the box for like $90
and you have one smoking computer controlled scanning system
that can be used on almost any computer. With other free software
available you can use it for tracking most trunked systems including
EDACS!
Good luck!

> Frankly, my attitude at the time was, "Keep your *@#! radio waves off my property."

The scanner people tried that arguement when they
wanted to listen in on Cellular calls legally.

They said if the radio waves are on their
property, passing through their bodies, they
should be allowed to receive them, and if they
can't then keep them off their property.

That didn't work for them so I doubt if you will
fare any better.

The rulings that hurt the scanner folks will help
your HAM neighbor in this case.

>If this happened again, I'd just hire an attorney.

I'm afraid you would just be wasting your money!

That's strange; I own a bunch of type-accepted
amplifiers made by Sonar, Courier, Kris, Johnson,
etc., that have type-accepted stickers on them and
they were designed for use in the CB band.

They are pretty old, but they are all still in
excellent working condition.

I don't want to fool anybody with this one but maybe you would like to fix it or have it repaired. The radio does work. I can receive broadcast. And Ham's on 60 (LSB) just fine. It seems to be off about 5khz on AM, but seems to be fine on USB and LSB. The VU meter sits at +5 almost no matter what is tuned (ver loud signals it will move. And as far as reception of ute stations, the radio sounds deaf compared to a DX-398. I haven't put in any time to find out what may be wrong with it, so I don't use it.
Manual with schematic (not a service manual) and power cord)

The Icom R2 is identical to the Icom Q-7 Dual band amatuer handheld with the transmit capabilities removed. As for performance, I have one of the Q-7's and often use it for a handheld scanner. It has excellent reception and for its very small size its audio performance is great.

Well, if the R2 is anything like the Q-7A, which from all those in the know tell me it is, after owning one for a little over a month, I must say it will be possibly a "best buy" for size, and for performance. The sensitivity and lack of intermod was more than admirable, and the audio will blow you away for the size, or for that matter, any size of scanner. If I didn't have my 8200, I would say absolutely "BUY IT".

You have a real acid test for a scanner. I live in Salt Lake City about that same distance from downtown, but the transmitters are mostly on the mountain tops. I get little or no intermod from a competent scanner. The Yupi's are by and large the most sensitive scanners made without most of the intermod problems that plague most others. I did however opt for a AR8200 over the Yupiteru 9000 for it's computer interface. As soon as they prove to have a comparable unit, I am sure I will own it.

I am not disputing that you own FCC type accepted amplifiers just the fact that they are not intended for the 11 meter band they were intended for the 10 meter use which with very little tuning (if any)can be used on 11 meters in fact back in the early 80's everybody went to a Amateur Radio shop to get there amps for the CB Band. Even back then they were still illegal for CB use.

Unless I didn't see the very first post I saw nothing that said that the Ham was running any power excessive or otherwise. As far as Ham's being able to run 1500 watts legally CB'ers are allowed to run 4 watts so what's the point interference is interference regardless of the power used.

Hello,

I am thinking about purchasing a Bearcat BCT-12. For those of you who haven't heard of it, it is a highway/police scanner that looks like a radar detector with a rubber-duck antenna (alothough it comes with a windshield antenna). Anyway, my question is if anybody has one of these what do they think of it? I have searched for reviews on the web, but have been unable to find any. If you have a review yourself or you know where one is, please let me know.

Thanks,

Scott Fuhrman

On I-10 from Blythe to about Beaumont, 42.44 is th current CHP frequency

about 2 weeks ago, I drove I-10 and pulled off at hayfield road to rest briefly. I drove back away from the freeway because i wanted a quiet place to rest. The CHP saw my driving away from th freeway and came to investigate. This was West of Desert Center and a few miles from Chiraco Summit. There, they used 42.44. i had a hard time explaining to them that my eyes were red because I was tired. If I had consumed any beer, it was root beer...I was drinking Dr Pepper. I finally told them that I thought they would like it better if I rested when I felt tired than continue on and they have to pick me up in pieces. They agreed.

IN the Metro Los Angeles area (110 freeway, near the Convention center), I was able to receive activity on several CHP frequencies in the 42mhz area.

This weekend, I was in the San clemente area for Breakfast, met another friend in Hollywood (near hollywood blvd and Vine) and had dinner with my friend in Glendale near the 5 freeway and Colorado Blvd.

In San clemente, I was listening to the soccer game via BBC at 17.835 on my AOR-8000 radio.

A CB antenna works well as a general purpose scanner antenna. I am considering going to A place near the 405/110 junction and getting an antenna for low band and another for higher frequencies.

Also ironic, is that the higher they place that antenna usually the less interference problems they will have. MK

In other words, your home entertainment/electronc equipment was
responding to signals that it should have been ignoring,
right?

That is true - the FCC does not have the personnel to fix
problems that the consumer electronics manufacturers should
have guarded against by proper desogn.

> I ended up solving it myself with the aid of a tesla coil. It
> would have been delightful if somebody else besides the FCC had
> been available to help with the problem.

There are all sorts of private-sector organizations which have
come into being in the last few years to do that work (which is
why the FCC doesn't), and in addition many of the amateur radio
clubs throughout the country offer this service to the non-ham
community. All you have to do is ASK, rather than demand or
take the problem "into your own hands".

As far as your solution, you should be fortunate that the
affected radio operator was not a client of mine. Malicious
interference with communications is a Federal FELONY (Sect. 333
of the Communications Act) and my law firm has all the forms
and contact phone numbers necessary in those instances, and we
don't need deep pockets for that, either.

The area of df-ing is one of the most tricky technical areas in
radio law enforcement. I LOVE to get non-technically-certified
witnesses on the stand and rip them to pieces in terms of the
veracity of technical maeurments that the FCC is the expert in.

Leave investigating robberies to the locals and doing df-ing to
the FCC.

> That means a competent
> witness to testify to the illegality of the operation. The more
> sophisticated RF crimes are generally beyond the ability or desire of most
> police agencies.

Making the df and testifying to the results of the df are one
thing. Testifying to the ILLEGALITY (or more accurately,
non-compliance) of what the station is doing requires a
competance in radio law that few if any "locals" - including
the vast majority of police and prosecutors - have.

"On my watch" the FCC staff had to "educate" a whole generation
of Federal judges and prosecutors in what radio law is - a
field wholly unknown to them until we showed up in their
offices and chambers, and these are the folks who are
supposed to be the knowledgeable support of the FCC! Imagine
all thre thousands of individual cities and counties across the
US.....

When I was with the agency it was very apparent that the
"locals" did not have the experience, qualification, or in a
lot of cases equipment to do the job properly. We spent a lot

of time trying to teach the more well-endowed local police
departments to use the df equipment that the taxpayer bought
for them to find interference to their own systems, and we had
to go back time after time because they couldn't evaluate the
data that the equipment gave them.

On Mon, 16 Nov 1998 18:57:04 -0800, Palsgraf wrote:

> of "who cares" among individuals disinclined to obey the FCC regs.

The proper solution is better funding of the FCC and a better
attitude on the part of The Congress, the Department of
Justice, and the courts to the importance of radio law
enforcement.

Keep the FCC out of investigating robberies and the "locals"
out of radio law enforcement.

Oh? What aspect of laxity did you deal with? Increasing the
agent slots in the District Offices by ten to twenty times the
present staffing? Persuading the Wireless Bureau to take the
cases that the field folks could have fed them on a regular
basis? Persuading The Congress to fund and support more field
enforcement?

THOSE are the issues involved in why you don't see more df cars
on the street. It's changing now - observe that in the last
two weeks there have been a lot more folks "caught" than in the
recent past. That's because somebody in the "front office"
finally got the gears in gear (kudos to the new Chairman and
Enforcement Bureau chief).

> Add in my QCWA membership, DXCC and local club presidency, field day
> chairmanship and technical committee member I figure I got as much right as
> the next feller to say something about the need for local authority to
> tackle some of the easier interference problems.

You have all the right in the world, but what you are
advocating is bad policy.

If we want to compare qualifications, mine are as a licensed ham
and commercial operator for over 45 years, graduate communications
engineer (Registsted Professional Engineer in several states),
radio law enforcement professional - journeyman and manager,
and communications attorney (admitted to practice in stste and
Federal courts and before the FCC) spanning a 40+ year career,
including 30 years' service on the enforcement staff of the
FCC.

My professional opinion is that radio law enforcement must
remain in the hands of the FCC and not be delegated to the
locals.

My experience with the locals is that they do not have the
background nor the experience nor the qualifications to do
radio law enforcement instead of the FCC. It is a specific
high-tech field, and we cannot afford non-specialists mucking
around in the business.

That's what I've been saying. Radio law enforcement is a
specialty that one has to do day after day just to keep current.

We used to have this dude down the street who had a ham radio.
Everytime he keyed up, some of the lightbulbs in our house litteraly talked with his voice.
Also, I used to pick him up on my soundcard and also on my stereo amplifier.
Did I complain?
You bet, but to him, not the city nor the police.

All right, I knew my name would pop up here somewhere. By the way
Steve, congrats on the movie, I can't wait to see it.
Now, about my favorite saying, I'm gonna put this to rest once and for
all. While I would love to claim total and undeniable responsibility for
this, I'm sure someone else will have irrefutable evidence that they beat me
to the punch. Not that it truly matters who said it first, but the irony is
the time frame that Steve and I started using almost the same phrase. And
the areas we were working in, hell who knows Steve, our paths may have
crossed.
July 1984, a junior 3rd class Petty Officer (ET3) Kidd, stationed aboard
the USS Reeves (CG-24) homeported in Yokusuka, Japan, posted a sign over the
SSES (Secure Signals Exploitation Space) that said "In God We Trust, all
others we scan!". It remained in place through several command inspections,
and received varying degrees of acknowledgement from all levels of command
staff (they thought it was funny). One day, prior to our arrival in Manila,
the IS1 (Intelligence Specialist Petty Officer First Class) demanded I pull
the sign down, NIS and NSA were boarding the ship in Manila for an
"investigation", (due to the loss of a specific item that fell under NSA's
jurisdiction). Although the loss of the item had already been confirmed and
the culprit, who happened to be a radioman, actually burned the damned thing
by accident, confessed, NSA and NIS had to investigate. The IS1, complained

to the CO, OPS, TAO and the EMO that the sign must come down, noting NIS and NSA investigators have a definite lack of anything that might be related to a sense of humor. The CO's response was "F___ them! Leave the damn sign up." We did, they came aboard, saw it and actually laughed (that, in and of itself, should have been a historic event recorded in Naval History). The NSA agent photographed the sign. End of prolonged and protracted story. So Steve, in your work with NSA, you probably saw the sign they stole from me. And NRO photographed the damn thing with a K-11, nah :-)

"In God We Trust, all others we scan!"

The FCC monitors and regulates all transmissions. It is their mandate and the reason for their existance.

No to temper that a little. Although they can come down hard on companies for these types of infractions, they more or less let the companies regulate themselves. As long as no outsider complains, they probably would never even look in your direction - ESPECIALLY with a digital transmission that needs similar equipment to un-digitize it so you can hear what your buddy has said.

Tell me, just how did your relative determine that the ham was running excessive power? Did he do a site survey with calibrated antennas, and calculate the ERP levels? Or did he just make an (bad) assumption that "he's coming through everything, so he MUST be running power"?

Remember, a ham is LEGALLY allowed to run 1500 watts.

Hi! I have Radio Shack Pro-43 scanner for sale. It is one of the later models which is not cell restorable. No mods, a cosmetic 9, and perfectly functional. Includes a duck, and AC adapter/charger.

Some specs:

200 channels (10 banks/20)
10 channel monitor bank (for quickly storing searched freqs.)

Covers:
30-54 MHz
118-174 MHz
220-512 MHz
806-1000 MHz (cell blocked)
AM/FM

$150 shipped to your door. No trades, please.

Please drop me a note if interested.

Cheers,

Paul WD8DKY

Source record: 137704
Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner

Greetings, all...

I have something of a problem. I belong to a group which operates two large parabolic dishes for educational and research purposes. We are quite poor... This weekend our ICOM R7100 turned a routine balloon-tracking exercise into a disaster with some strange behavior, probably in the 1st IF. I'm looking for someone capable and trustworthy to check it out.

There's only one problem. This is a continuous coverage 7100, which makes it ideal for use with downconverters from microwave regions. The blocked 7100 versions are somewhat draconian in that they block all of 800-900 MHz. We'd like -- if possible -- to avoid getting a blocked receiver back from ICOM (which would be the natural choice to inspect/fix the receiver). (We'd also like donations of R8500's -- even blocked -- or surplus commercial gear to replace it, but I digress...;-))

So... what are other people's experiences with ICOM -- do they return "pre-blocked" receivers with "blocks?" What about independent operators?

As I said above, we are quite poor -- meet our money sinks. One has a 400MHz feed, the other has no feed mounted.

http://www.dimensional.com/~rcraig/dses/images/

Thanks in advance!

Eric, KB0YDN

Don't forget the frequencies that CB'ers operate on have harmonics that plop
right into the TV broadcast bands. Not hard to figure out that non-type
accepted amplifiers can easily boost those harmonics to a
>powerlevel that will just kill many underprotected consummer electronics
>items.
>
Could you please tell me just what is a type-accepted amplifier for CB.
Unless you are considering a legal (or illegal) radio a amplifier of which
it is but not the kind I think you were refering to.

5027. Yet another question about cellular...

Newsgroup: rec.radio.scanner
Date: 1998-11-17 00:00:00 UTC
From: (unknown)
Message-ID: <3652e110.9156272@news.mindspring.com>
Source record: 137706

While listening to 1st/2nd IF images (of, say, cellular base transmissions) on my PRO-26 I have noticed that sometimes I hear only one side of a conversation, sometimes two. It also seems that it isn't dependent upon which (cellular base) freq the conversation is taking place; I'll be monitoring a specific freq, listening to a one-sided conversation, and then the next call intercepted (on the same channel) will be two-sided.

Is this a quirk of the individual's phone, their cellular service, the cell site transmitter, or my scanner (effects of triple conversion)? Would this change if I were to modify (e.g. logic board / cpu) the radio to operate in the "true" frequency range ? Or is that just the nature of images?

Thanks for your help.

A CB'er is limited to 4 watts and that power level seldom causes
problems. If the CB'er is causing problems he is probably running an amp
which is illegal and thus his fault.
Jones <Jones@nomail.com> wrote in message news:3651B4A9.37AF@nomail.com...

You stated my point very well. We hop right back on CB'ers operating illegally not Hams which is beside the point anyway. You can operate legally and still cause these types of problems regardless whether you are a Ham or CB'er, granted it is a lot easier on the 11 meter band but interference is interference Ham or CB and a neighbor usually doesn't know the difference. If you are in to semantics I will change it to some Hams and some CB'ers. Regardless how it was said I think you got the point.

Someone mentioned that it's difficult for the FCC to determine signal purity and output power. This is untrue. A spectrum analyser in an FCC van parked anywhere nearby will be able to nail down some very accurate readings. The FCC inspector, upon inspecting your station, will transmit on your station with a bonafide legal maximum power signal and again take a measurement. If his is weaker than yours, you're busted. He can also use the opportunity to check your station for signal purity by firing it into the calibrated test set he is invariably carrying around in his van. If your radio is over-peaked, you're busted. He will also check the frequency coverage of your transmitter. If you do not hold an amateur radio operator certificate - guess what? You're busted again. There's no magic to this. In Canada here if a known a**h*le is operating illegally, the DOC will be accompanied by an RCMP officer, or two, whom have very powerful search & seizure priviledges. In other words, if you don't let 'em in, there comin' in anyway. And of course, if you're causing avoidable trouble with an illegal station of any description you really have to ask yourself if you should find another, less annoying, hobby. A DOC inspector once told me that when investigating interference complaints, ninety nine times out of one hundred, the offender is unemployed. There's an awful lot of dick-swinging on the CB - and that's fine. But when you start swinging your dick far and wide enough to piss off others you're gonna get caught!

Thank gawd I type 100wpm......8-)

Message-ID: <72srp8$qn2$1@phxtst22.phx1.aro.allied.com>
Source record: 137713

I have gotten many, many requests for this URL, and rather than answer each email individually, I thought it better to post it here, for the benefit of all interested parties. Here it is:

http://www.mghusa.com/scanner/pc895/

For those of you who have no idea what the heck I'm talking about, PC895 is a windows program I wrote to program and control the BC895 Trunk Tracking scanner. It does have some bugs, and doesn't work for everyone, but it *is* freeware. I created it simply because it was fun to do so, and I had a need for it at the time.

I have decided to go ahead and create a version 3, so any and all bug reports, wish lists, wants, needs, and dreams for it will be gladly accepted. Please send them to: phillip.smalley@alliedsignal.com or ziggy7445@yahoo.com

Enterdev software no longer supports this program, and I got a nastygram from them saying they will no longer answer any email for PC895. So please direct your inquiries to the addresses above instead, otherwise you'll be ignored (nice touch, huh?).

Since the program is freeware, there will be no beta testing. What you see is what you get. I will however post revisions to the program to correct bugs, etc.

And, of course the standard disclaimers: I am not responsible if it blows up your radio or computer, etc, etc. (It shouldn't, but anything's possible in the hands of just the right people...). Also, I do have a full time job to attend to, so don't expect a new release every day - I do have a life people...

One last thing, does anyone want a DOS version? There may still be some die hard Windows 3.1 folks out there.... ask and ye shall receive...(as soon as I write it, of course.)

Thanks,
-Phil

Thanks to both you and Jack for the links and info on the tracking goodies. I'll check them out. I also found a couple of links on Steve Hancock's Pro-2006 page that were helpful.
You got a good deal on the 486...makes a darn nice dirt-cheap scanner controller. 60 channels/sec is decent. I can get that on my 486/100, but it's a little flaky, so I need to tweak things a bit. Have fun with the new setup!

Source record: 137717
Cross-posted to: rec.radio.scanner,sci.electronics.repair,alt.radio.scanner

I also had the same problem, turn it on and it would work for a little
while, then the LCD would get funky and I had to turn it off and let it
sit awhile. I finally found the problem, the connector cn6 pin 3 (red
wire) should be 8v and it connects to IC9. Using a meter the top of
the lead to IC9 was 8v but it went to a feed though to make the connection
to the red wire, this was only a couple of volts. I had to put a wire
through
the feedthrough hole and solder both top and bottom. Unit has been
working fine since then.

Internet America wrote:
>
> The FCC monitors and regulates all transmissions. It is their mandate and
> the reason for their existance.
>

Not exactly correct. They do have a right to ensure that transmissions
are on the proper frequency, with the proper bandwidth and power. That
does not translate into "monitors all transmissions". They don't have
the staff or equipment to do that, and in the case, for example, of GSM
mobile phones, they can't even decode what is being said.

> No to temper that a little. Although they can come down hard on companies

> said.
>

If you do the legal research, you will find that mobile phone companies
are public carriers who are not liable for the actions or content of
their subscribers during the use of their facilities.

And since it is illegal in the US to intercept or divulge private
communications, whether scrambled, encoded, or not, (amateur radio and
CB are NOT included in this), anyone who complained would be
incriminating themselves. You will find that profanity during cellular
or pseudo-cellular (iDen) use is not a problem, unless the person on the
other end wants to punch you out....

I'm having similar difficulties with the BC235XLT (300 channel). I discovered
that (after entering the trunked frequencies) to access the talk groups, you
hold the TRUNK key for ~2 seconds, TRUNK appears in the display and immediately
push the keypad button corresponding to the bank you just entered. You may
then enter the talk groups (if you wish) or just search randomly. Let's stay
in touch. Let me know specifically what you're having a problem with.

Source record: 137721

I recently received the BC 235XLT (identical to the PRO-90). Other than spending considerable time deciphering the less than friendly instructions, it's a great unit!
I'm still confused and learning all the options. IT IS NOT a radio for a beginner! I say that because it might be overwhelming and just more than what a newbie needs. Keep in mind, the MAXIMUM number of TRUNKED channels that can be scanner at any given moment is 50. (That is for one system). There are a total of 300 channels to store frequencies in - more than most people will probably use.
Another limitation-you can only monitor those 50 channels (TRUNKED) or any other non-trunked frequencies at a given time-but not BOTH at the same time. So, for example in San Diego, I cannot monitor the C.H.P. in the low band and the City Police or other agencies on their trunked system at the same time.
Despite what I've read in this NG, the audio is good. Some people feel it's not loud enough for use in the car. Use a cassette audio adapter and run it through your stereo!
I'm not sure about running it on 12volts however-it doesn't appear to have that option.
The two battery packs are a MUST. The radio will use each pack in about 8 - 10 hours.
Buy the optional extending center-loaded antenna w/BNC connector. It makes a lot of difference. Let me know what you decide.

That is why the City of Lafayette is having a commerical radio
repair shop, staffed with GROLs, to act as expert witnesses.
They know the law and the technology.

>
>The only areas should be for local authority, as an example, to track down

Hams are not the only people with technical expertise. And one does
not need to a professional (lawyer, engineer) either. The typical repair
shop, the Indiana State Police have GROLs in house, can provide such
expertise.

Local communities are becoming pissed with the Feds passing laws
then expecting someone else to enforce them, usually on the local tax

dollar. That is what happened with the Brady bill. The new tact is to so fuck things up that the local community wants to take matters in hand.

There are no amplifiers that are Type Accepted for the CB Class D
band. It is forbidden for amplifiers to be made for those frequencies
thus no type acceptance by the FCC. Thus all amplifiers used on the
Class D band are illegal. Go to jail.

Good question - I don't know precisely how he came to that conclusion.

> Did he do a site survey with calibrated antennas, and
> calculate the ERP levels? Or did he just make an (bad) assumption that
> "he's coming through everything, so he MUST be running power"?

He didn't do a site survey, that I know. His assumption may have been bad. He was, however, much more knowledgeable on the topic than I was.

One of the problems we have here, I think, is that it is difficult for non-CBers or non-hams, like me, to understand that it is apparently OUR
fault when we lack the technical knowledge to be able to pick our consumer electronics with more expertise so that we don't get RFI from a neighbor
like mine <sarcastic grin>. And then to be told - as I was at the time - that I'd have to spend what was, for me, big bucks on filters to be able
to use my electronics without hearing my neighbor added insult to injury.

Frankly, my attitude at the time was, "Keep your *@#! radio waves off my property." If this happened again, I'd just hire an attorney.

Im looking for the Informix freq. They are located in Menlo park zip 94025. I cant find it and 10 others who have responed have had no luck.

Really need a frq finder expert

Thanks
Jack

5056. PRO-90 (Scan List)

Newsgroup: rec.radio.scanner
Date: 1998-11-17 00:00:00 UTC
From: John Morse <jmorse@whisp.com>
Message-ID: <zQ542.454$OT5.420284@198.235.216.4>
Source record: 137735

Hi!

I just purchased the Pro-90 and have started goofing around with the TruckTracking. In order to scan all my favorit Frquencies and to cover all the Police Services in this city, I need to use the Scan List, because the banks of 30 channels each just don't cut it seeing this one police force has 67 Frequencies to use. Now with reading the Manual, It looks to me that in the one Scan List it will cover up to 50 Frequecies, and this is a lot better then 30 Channels. But I can't seem to get it to manually input. The Talk Group number matches up to the Truck Frequecies of the local Fire Department in my town and there for I don't here anything on the nieghtborouring City. Can someone please help me out here?

Please E-Mail me: jmorse@whisp.com

John

The scan lists will each hold 50 of the type 1 or type 2 (depends on type of fleet map you are using) user id numbers. That is different than the 50 frequencies as you put it. A frequency is not the same as a 'user id' number. Unfortunately, unless someone out there has a trick out there that I don't know about, you can only program 30 trunkable frequencies per bank and in that given bank, you can only enter 50 of these 'user id' numbers. Good Luck

On my RS Pro-90, you must hold the trunk button until you hear 2 beeps, then choose the bank you want to work with. Then, press the data button and then select between either 'E1' or 'E2' (I forget which one is which type of user id. Then press the data again and then 'search' and when someone talks, you will see your results.

It is a piece of cake! The OS456 has a wire (blue?) connected to TP-2
on the board! That is the discriminator output. Just run a wire from
there to a rca jack mounted in the back. TP-2 goes to the center of
the jack, the metal case serves as ground. It will have no effect on
the opto board.

Yes, yes!

I had trouble with a neighbor ham's interference - came in on _everything_ with a speaker, couldn't watch a movie on the VCR, etc. FCC couldn't help - they told me they didn't have the personnel.

I ended up solving it myself with the aid of a tesla coil. It would have been delightful if somebody else besides the FCC had been available to help with the problem.

ZAP!

The tesla coil makes "snow" on tvs and some buzzing, not real loud, in lots of things with speakers for, oh, maybe half a block or so. I set it up in the room closest to the guy's house, attached about 100 ft of wire to the terminals (an attempt at "amplification") and turned it on. He ended up hearing the buzzing, too, and shut down :-). And none of my neighbors could watch tv for about 10 minutes or so, until I turned it off. I don't know if he ever found out what was happening, or who was doing it.

The darn things cost about $200. This one was left over from my brother's pre-college days. Trying a bunch of filters would have been nearly that expensive, however.

I have a lot of elec. engineers in my family. My dad found a way to load down the antenna or something like that, too; it involved cutting a piece of wire to a certain length (depended on what frequency the guy was broadcasting on), grounding it. I could have set it up on my property, it didn't have to touch his equipment. But the tesla coil was easier.

As I told my dad, it's nice to know these advanced technical educations have practical application to everyday life <big grin>.

And after reading all that has been posted here, you still don't realize that it's not the fault of the ham in question that his radio signals interfered with your electronics, but the fault of the manufacturers who skimped on your gear, leaving out inexpensive components, which saved them only pennies but which would have protected your gear from that sort of interference. Your TV, VCR and telephone are not radios and should not respsond to a radio signal that is proper. So now all the unknowing point all their fingers in the wrong directions.

Which, BTW is at *LEAST* as ILLEGAL as any activity that the
"ham" might indulged in.
Actually I doubt it was a ham-they rarely cause major problems-they
usually have the knowledge and the common sense to avoid most problems.
Of course, lousy consumer electronics cause way more problems than
poor/defective/illegal transmitters do.

I have a friend telling me this is true, but I don't think so. If I am not mistaken, Motorola's iDEN technology is used for both the 2-way and telephone feature, and 2-way is just half-duplex instead of full. The FCC doesn't monitor and regulate any of this, does it? A friend in my workgroup is concerned about the language we use on the air, like it's a CB radio or something. Anyway, I just wanted confirmation before I shot him down. Thanks in advance for any insight!

My understanding is (from the last time I looked at the allocation
charts on the Radiocommunications Agency web site, about 3 weeks ago)
that the TACS frequencies were now being used for GSM and the ETACS
frequencies were effectively permitted interlopers on government bands
(which presumably will revert to the Government when the analogue
systems close). However many analogue mobiles there are out there, when
the government agrees with the network operators on a switch-off date
for the analogue systems, then that's the end of the analogue networks -
all subscribers will have to move by that date, or be disconnected.

The only network offering analogue pay as you go was Vodafone, and it
appears to be in the process of being dropped in favour of digital pay
as you go (certainly it's the digital handsets that are being heavily
plugged at the moment).

Of course! What would you know about using a radio Greg? ;-)

Figure that the BC235 is just a BC220/230 so they just massaged this
design to get the BC235 with minimal cost. And the BC895 has the
same layout as the BC8500, BC9000 and BC890.

I have for sale the following Motorola Portable.

Motorola STX-821E
800 Mhz Smartnet Trunking Portable
Supports Type I, II, IIi hybrid systems and conventional personalities.
96 Systems with 16 talkgroups each
Full Keypad and Display
Call Alert, Page, Phone Patch and Scan

Model # H35STE5170CN

Radio is in very good condition. Comes with an Antenna.

Asking $675.00 + FedEX 2nd Day COD

Thanks!

I thought that the analogue frequencies lie within the GSM 900 band (a factor in the choice of the GSM 900 band), and that as analogue services were run down these frequencies would be taken over for GSM. Few years yet before that is complete, mind.

> interference and add an antenna to it.

All radios will give you interference to some degree. It's the design of the radio as well as the environment in which it is used that will dictate the type and amound of interference.

If you live in the "sticks", you'll want a radio with good sensitivity to pick up the weaker, far away signals. If you live in city, you'll want a receiver with good interference rejection...you're right on top of the signals you'll probably monitor the most and therefore have no need for brute sensitivity.

> I'd like to know if this would
> make the scanner as good as other more sensitive scanners like the
> Yupiteru or what have you only without the interference.

What you seem to be desiring is a radio with good dynamic range... the ability to hear weak transmissions (good sensitivity) without being unduly overloaded by stronger transmissions. Perhaps the best handheld ever made in this category would be the Radio Shack PRO-43 with the PRO-2006 a good base model example.

But you are right to worry about the 7100 overloading. It is very sensitive and prone to this type of interference...which can be a problem if you live in a hostile RF environment.

As for your question regarding a less sensitive radio with a better antenna, this would make it more sensitive and put it back in the ranks with the 7100 in terms of overall sensitivity. But since you are increasing signal strength (with the enhanced antenna), you run the risk of overloading the radio and producing the same type of interference you were hoping to avoid. Depends on the design of the radio and how well it can handle the extra signal.

Hopefully, by now, you realize that this is not a black and white issue...it has varying degress of 'grayness'. Do your best to learn what you THINK will work for you. Try it out and learn just like the rest of us have to do many times. ;-)

> There are
> plenty of good scanners without interference problems for around $300
> like the Uniden 3000, Realistic Pro-26, Icom R2.

If you think those radios are without interference, then you would be mistaken. You can read my reviews of all four of these radios to see how much and where each one gets it. While these three might be a bit more resistant, they can still be overloaded. Add a better antenna to them and you MIGHT be just as bad as using the 7100 with its stock antenna.

And comparing the BC3000XLT and PRO-26 to the MVT-7100 and R2 is a definite apples to oranges comparison.

You might want to check into a used IC-R10. Dog slow and quirky but decent sensitivity with good overload protection, computer control and wide range.

The laws concerning the use of profanity on the air applies to all transmissions, regardless of how they are licensed. However, since the FCC would need a court order to monitor you transmissions on iDEN, I rather doubt anyone is going to get in trouble for swearing on the air since iDEN's Direct Connect isn't a public medium.

Why is it when a Ham creates a problem with TVI it is the TV,Phone etc that is a fault but when a CB'er creates a problem with same it is the CB'ers fault. A bit of a double standard don't you think. I have been saying for years it is usually the TV's fault but that doesn't seem to work unless it is a Ham that is creating the problem. Don't get me wrong I would have gone about correcting the problem a different way. BTW Bill at least you do admit that Hams do indulge in illegal activities from time to time just like CB'ers.

He was a ham, beyond any doubt. He may also have been a CB-er; I don't know.

It was the opinion of a relative of mine, also a ham, that the fellow was illegally boosting his signal (if it was ham that was interfering).

You simply cannot imagine the frustration of having to put up with something like this, though. The guy was audible on everything in my house with a speaker - including my sewing machine!

You can make all of the items needed to program
your radio if you already have the software.

Check this web site: http://www.batlabs.com/2way.html
there is everything you need listed there.
You can also purchase cables, RIB, etc. from 2-way shops,
you'll save money if you buy third-party built equipment, which
I did, (I use my Motorolas for ham radio) instead of Motorola
made stuff.

They jumped the gun on the Feingold Amendment which never
became law -- it passed the Senate and was stalled in the
House. It was 'sposed to be a rider on a budget bill but it
didn't make it in time. Whew!! Close call....

The situation as I know it from a source in that area was that
a CBer was getting into a neighbor's telephone (power level
unknown), and the CB operator offered to buy her a bullet-proof
phone. This was rejected and the wheels started turning. I
have yet to see the actual ordinance but it allegedly covered
only overpower and out-of-band CB, the same stuff that the
Feingold Amendment would have covered.

As it stands, Lafayette (or anywhere else) has no authority to
enforce CB rules. There is a specific U S Court of Appeals
ruling that is very clear that the FCC has exclusive
jurisdiction over cases of interference to home electronis
equipment.

Let's see if we can keep it that way.

My offer stll stands.

A CB'er is limited to 4 watts and that power level seldom causes problems. If the CB'er is causing problems he is probably running an amp which is illegal and thus his fault.

The ham is allowed 1500 watts and that power level most likely will cause problems with consumer electronics. However there is a ham regulation that requires the ham to use the *minimum power* necessary to make the contact. Many hams ignore this and have the "I got an amp so I'm going to use it attitude". Even the "barefoot" 100 watt guys seldom ever reduce the power knob.

So in many cases both are at fault. The consumer product for picking it up and the ham for using unnecessary power.

The one big advantage of QRP (5 watts or less) ham operating is that you generally have happy neighbors...

I can state categorically that 4Watts is ample to blow your neigbor out
of his house. I've done it myself! 8-) Amplifiers are not the only
culprits - but I grant you they can certainly aggravate an RFI problem.
If you point four co-phased Super Big Guns through your neighbors house
I guarantee you that you'll hear about it.

It's the fault of the Gov't for selecting a band that is completely
innappropriate for what it was originally intended. 8-) (If in doubt,
always blame the gov't, right?)

> The one big advantage of QRP (5 watts or less) ham operating is that you

Wish you would modify it to say "some" hams and "some" CB'ers. The vast
majority of both hobby groups operate legally without causing problems.

Don't forget the frequencies that CB'ers operate on have harmonics that
plop right into the TV broadcast bands. Not hard to figure out that
non-type accepted amplifiers can easily boost those harmonics to a
powerlevel that will just kill many underprotected consummer electronics
items.

I'm not saying I want to eliminate unwanted noise from a scanner, I'm saying I'd like to take a good scanner that doesn't give you interference and add an antenna to it. I'd like to know if this would make the scanner as good as other more sensitive scanners like the Yupiteru or what have you only without the interference.There are plenty of good scanners without interference problems for around $300 like the Uniden 3000, Realistic Pro-26, Icom R2.

Let me give you a bit of free advice - the Pelican molded plastic cases are
better. Strong, more durable and more protective.

Sure, they don't have the same secret agent appeal, but if you want it to
survive some hard field use, go with the Pelican cases.

Yeah, right. With an e-mail address and screen name like that I'm gonna send you $600.00? NOT! Hell, I might as well just burn the money myself and save the 32 cents postage.

5107. Re: Cordless Telephone Frequencies

Hello Group,

>>>Barry is located in Australia. Those frequencies are valid for corless phones Australia and New Zealand only!<<

I missed the original post, but I wonder if some of the freq's quoted were the old "mobile telephone" frequencies? Have these freq's been reassigned to other services?

Questions and Answers
=====================
01: What is the most important ingredient to enjoyable scanning?

There are three vital ingredients to successful scanning:

A. The antenna
B. The coaxial cable (feedline)
C. The scanner

Let's put it into perspective. If I had $500 to put
into a scanner monitoring post, I would invest $400 of
it in the antenna and coaxial cable system, and $100 in
the scanner. Don't take that too literally, but give
the principle some deep thought. The antenna and
feedline make all the difference; not so much the
scanner. But a lot depends on your interests. A $500
scanner and a 12" piece of wire sticking out the antenna
jack will pick up a lot of local signals and you might
well be "happy" with that situation.

If you want to "hear all there is to hear" and more,
then your first concern is the antenna and feedline. So
long as you have a scanner in the first place and so
long as it does what you want it to do, then the antenna
and feedline are the most important elements of your
station.

==========
02: So what do I need to know about antennas?

You are kind of fortunate, unless you're a ham, SWL'er,
or a CB'er. These guys need to know a lot more about
antennas than a scannist. Still, there are some crucial
things to know.

Antennas seem unimportant to the scannist because there
are few from which to choose, and anything from a

bailing wire to a rubber duckie to a piece of aluminum seems to work just fine. And it does, but Catch-22 is the "why".

One of the characteristics of scanner signals (30 MHz VHF and up) is that they're "line of sight" for the most part. And line of sight means strictly a local geographical area. So it's easy to be deluded into thinking you are hearing all there is to hear. And so your antenna seems good enough and not worth any further ado.

Again, this is okay if your interests are casual and limited to local signals. But here, in as few words as I can put them, are the hard core, brass tacks facts about antennas as related to scanning.

The Scanning Spectrum
=====================

Scannists typically are interested in all signals between 30 MHz and 1300 MHz or higher. Antennas typically are "resonant" and very narrow banded. That's why you see "antenna farms" around serious ham shacks and SWL posts. It takes a separate antenna for each narrow interest, to put it mildly. In the scanning spectrum of 30-MHz to 1300-MHz, there are no less than two dozen separate "interests", so imagine having 24 or more antennas on your house.

Fortunately, most scannists get by with a single antenna that has a special design to make it cover that full spectrum. That coverage comes at the expense of performance, however. Here's why:

Antenna Characteristics
=======================

Antennas do to radio waves what glass and reflective surfaces do to light: they capture and focus radio waves. A telescope captures and focuses light with a comparable result in antennas that we call GAIN. Like in telescopes, the higher the power or GAIN, the narrower the field of view. In a word, look though a window glass for a wide field, or through a telescope for a narrow field.

The field of view in a telescope can be roughly compared to the spectral bandwidth of an antenna. The wider the bandwidth of an antenna, the lower its GAIN or power.

Scanner Antennas
================

Antennas for scanners are wide banded at the expense of no GAIN. This applies to all scanner antennas, regardless of what they are called. The most commonly used antennas for scanners are "discones" for base stations and "rubber duckies" for handhelds. Both are very widebanded and very low GAIN. But they work. Sort of.....

In addition to discone antennas, there are a few other kinds from various manufacturers, but you have to go by their trade names because there isn't a good generic word for them like the "discone". An example of the discone is Radio Shack's #20-043. Examples of "other types" are Radio Shack's #20-176 and #20-014.

Discone Antennas
================

In addition to physical shape, discone antennas are characterized by an extremely wide bandwidth and a relatively "flat" GAIN of about 0-dBi, in other words, no GAIN, but a bandwidth of several octaves. "No gain" doesn't mean the antenna won't work. All it means, to use an optical comparison, is a view similar to a 3-dimensional, 360-degree "fish-eye" lens...that sees all directions within a sphere equally well. The human eye, in comparison, has some gain since it sees roughly only a quarter of a sphere with much better resolution of distant objects than a "fisheye" lens.

Well, a discone antenna receives on a par with a theoretical "point" antenna that is given to receive equally well from all directions within its sphere. This point antenna is called an "isotropic" source, and does not exist in reality. Its reference GAIN is stated to be 0-dBi (zero decibels with respect to isotroptic). All GAIN figures of antennas should have a reference (gain over what?), and the theoretical "isotropic" antenna makes one such good reference. Thus, a gain antenna might be stated to have 5-dBi GAIN, meaning 5 decibels of gain over an isotropic antenna. (See discussion ahead on "decibels". Discone antennas have 0-dBi (or less) gain.

Other Scanner Antennas
======================

Some antennas, like Radio Shack's #20-176 and #20-014 are actually several optimized antennas packed into one. #20-014, for example, combines three antennas; a short UHF stub, a longer VHF-Hi element, and the longest VHF-Lo element. The three optimized centers appear to be around 450 MHz, 160 MHz, and 50 MHz. Considering that any antenna has "overlap" on either side of its

optimal center frequency, this #20-176 antenna can be said to cover 30 - 1300 MHz.

What they don't tell you about these "combination" antennas, is that there are DEEP nulls or pits across their spectral bandwidth. For instance, the #20-176 antenna might actually perform worse on the military aero band (225-400 MHz) than a "flat" discone antenna, but it may beat the tar out of a discone on the 150 MHz Land Mobile band. Antenna Specialists, Inc., Channel Master, and Austin Antenna are makers of various styles of these "other" antennas.

In general, these "other" antennas cost a lot more than discones, but do not provide overall better performance.....just on selected bands, where GAIN might be upwards of +3dBi, and in the off-bands, it might be as low as -6dBi. This isn't a fraud or even a fault; it's just a fact that scannists tend to monitor four key bands:

30-50 MHz 108-176 MHz 400-520 MHz 800-900 MHz

So if a manufacturer can optimize an antenna for these four bands and prove that it outperforms a discone in those bands, then you might well hear a lot of hype, hyperbole, and hoopla about it.

If you are interested in what goes on between these primary interest bands, say 72-76 MHz, 178-400 MHz, 520-800 MHz, and 900-1300 MHz, then these "other antennas" might well prove disappointing.

Directional Beam Antennas
==========

Scannists typically want to hear all there is to hear in a 360-degree circle (azimuth). So the discones and "others" as discussed above are the predominant choices. These antennas are called "omnidirectional" because they receive equally well from 360 points around the compass.

There are, however, other kinds of antennas that work much like a telescope, where they capture lots more signal from one direction and much less from all others....exactly like a telescope! These antennas are called directional beams, and resemble outdoor TV antennas in appearance and in how they work.

Probably the premier directional beam antenna for the scannist is called a "log periodic". It is very wide-banded, as a scannist needs, but it also offers two other hot parameters: GAIN and REJECTION. We have

already discussed GAIN and compared it to a telescope. REJECTION is also an important parameter. Not only can you use a telescope to see better what you want to see, but you can also use it to NOT SEE what you don't want to see! This is a rare application for telescopes, but a neat trick in scanning where nearby strong transmitters often interfere with more interesting, but weak and distant signals! How often have we complained of "pager interference" and intermod?

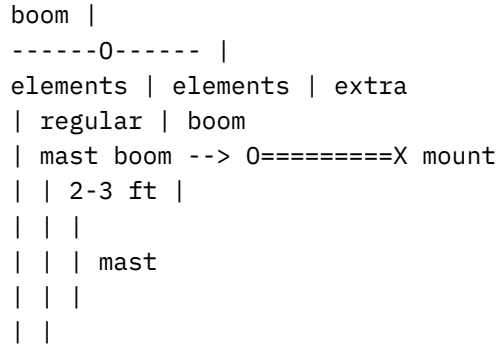
Well, you can use a directional beam antenna to REJECT undesired signals from one direction, often without degrading a desired signal from another direction, depending on how you point it.

Log-periodic antennas are expensive and sometimes mechanical nightmares to erect and keep erected. There is an alternative.

Think about it: TV ANTENNAS!!! Why not? TV antennas are low cost, highly directional beams, designed for 54-88 MHz, 88-108 MHz, 174-216 MHz, and 470-890 MHz. Thanks to "overlap" effects, they also work fine between 30-54 MHz, 108-174 MHz, 216-470 MHz, and 900-1300 MHz; a lot better than discones or "other" antennas.

TV antennas employ a combination of log-periodic, yagi, and folded dipole arrays to achieve high GAIN; excellent null rejection, and light-weight. The primary Catch-22 in using a TV antenna as a scanner antenna is to mount it in the vertical plane, and NOT horizontal, as TV antennas are deployed. Here is a diagram:

NORMAL TV ANTENNA MOUNT FOR SCANNING



Turned 90-degrees!

The subject of antennas can go on and on, but for the scannist, it needn't get too deep. If you want some plain, solid advice that involves least time, trouble, and cost, then put up a discone antenna for base stations. Radio Shack's new #20-043 appears to be a

good one. Two known good discones include the Icom AH-7000A and the Diamond D-130J, both available from radio stores everywhere.

If you have specific needs, then an "other" antenna might be the ticket for you - also sold by radio stores everywhere. If you just have to reach out to the hinterlands and boondocks, then you have no choice but to put up a directional beam. A TV beam antenna offers the most bang for the buck and still keeps it simple.

For handheld scanners, you may as well stick to the supplied rubber duckie antenna, at least when you're hoofing it about town. I hear about so called "hot-shot" special design rubber ducks, but just between you, me, and the doorpost, save your money. There are limits to what can be received at tabletop or waist-high level, no matter how good the antenna. But see Question #4!

==========
03: So what do I need to know about coaxial cable and feedline?

A. Don't use RG-58, RG-59, RG-8x, or RG-8M under any circumstances. These cables are too lossy. Up to 90% and more of the signal can be lost in these cables before the signal ever gets to the scanner. You don't need such losses!

B. Don't feel like you have to use the buck-a-foot cables, either. There is a point of diminishing returns where cost escalates out of proportion to any savings of loss. The compleat scannist might opt for Andrew LDF2-50A hardline coax, but at over two bucks a foot and $40 or more for each connector, there is usually no point in such extravagance. If there is a point to it, you'll know. If there is any doubt, then there isn't.

C. Most scannists do just fine with RG-6 satellite cable. It's cheap; it's low-loss; and it's well shielded. Furthermore, RG-6 takes cheap connectors, even the ideal gold-plated ones are cheap enough. Just put a gold-plated Type F connector on each end and then get the appropriate Type F-to-whatever adapter to mate with the antenna and the back of the scanner.

D. "Purists" may want to consider the 70-cents-a-foot Belden 9913 coaxial cable. It's extremely low loss and connectors for it aren't all that costly. 9913 can be worth it, but the difference between it and RG-6 isn't all that marked for most scannists.

E. Make sure all connectors are properly installed. Connectors are the weakest link in any radio station.

In summary, coaxial cable is a strong point of focus for the serious scannist because it is the single place where for a modest expense and a little time, losses can be converted to gains. To recover 2 or 3 dB of losses in an old cable is like adding 25% to your range of coverage! If you want a rule of thumb, use RG-6 Satellite cable with gold-plated connectors and adapters to keep the losses to an acceptable minimum. See next question for more info on this subject.

==========

04: How can I improve my reception capabilities?

Easy - maybe. Just increase the height of your antenna, no matter what kind it is.

Each 10-ft increment of added height can yield an apparent "gain" of up to 3-dB. For scanner signals, 3-dB can be all the difference between good reception and none at all! There is no substitute for height of the antenna when trying to receive signals outside your immediate geographical area of more than a few miles.

VHF and UHF signals weaken dramatically as they travel along the surface of the earth (groundwave or plane-earth wave); much more so than the spacewave that travels a couple of wavelengths or more above the earth's surface. Antennas at low heights intercept the spacewave of only very close transmitters, and the groundwave of all others. Yes, the quality and type of antenna makes a difference to a station's reception capabilities, but the single most important factor is the height of the antenna, regardless of its quality and type.

Next to antenna height, the quality of the coax cable is an important variable. Just about any coax is fine for 10-ft runs or less. If over 20-25 ft, then use RG-6 satellite cable unless you want to go whole-hog on Belden 9913 or Andrew LDF-2A hardline coax. In no case, should you use RG-58 or RG-59 cable except on very short runs, and not even then???? Signal loss in those two cables makes the difference between hearing and not hearing, compared to RG-6 satellite cable.

Do NOT pay any mind to the prevailing opinion in some quarters that 75-ohm coax is too lossy because of the impedance mismatch.

That's foolishness. 75-ohm coax connected to a 50-ohm load results in a 1.5 : 1 VSWR, for a 4% signal loss

(about 0.1-dB), hardly worth a bead of sweat compared to
the natural 25%-50% losses in RG-58 and RG-8 cables.

Antenna height and good quality coax cable will help you
hear all there is to hear from your location.

==========
05: Can my scanner be interfaced to a computer for remote
and automated control, as well as for programming of the
memory channels by the computer? Can the interface
acquire data from the scanner and send it to the
computer?

In a word, yes. Many scanners "can" be interfaced to a
computer for one-way control and automated programming
of the memory channels. These scanners include:

PRO-2004 PRO-2005 PRO-2006 PRO-2035 PRO-2042
PRO-2041 PRO-2022 PRO-34 PRO-37 PRO-39
PRO-43 PRO-26 PRO-64

Probably quite a few others are possible.

There are three scanners that are capable not only of
the one- way mode of remote control and automated
programming, but also of a "data acquisition" mode where
the scanner sends its display (channel, freq, bank,
mode, delay, lockout) and other data to the computer for
automated logging and data processing. These scanners
are the PRO-2004, PRO-2005, and PRO-2006.

Several companies make scanner/computer interfaces,
including Optoelectronics and COMMtronics Engineering.

Each interface has its own unique characteristics,
advantages, and limitations, but all are "good" in the
sense of freeing the operator from much of the labor and
drudgery of scanning. The Optoelectronics interfaces are
generally limited to the PRO-2005/6 & PRO-2035/2042.

A "roll your own" computer interface was published in
the World Scanner Report, V2N1-V2N6. Another more
powerful one was published in my 3rd book, THE ULTIMATE
SCANNER (Cheek3).

COMMtronics Engineering's CE-232 Scanner/Computer
Interface is in its fifth year and continues to be a
front-runner and state of the art. For more info:

http://ourworld.compuserve.com/homepages/bcheek/
ftp://ftp.cts.com/pub/bcheek/ce-232

John Montalbano KA2PYJ, seems to have designed a nice
one-way interface and control software. I can't vouch

for it, but go to the following URL and see for yourself.

http://www.qsl.net/ka2pyj/

==========
06: Will a preamplifier be helpful to pulling in weak signals?

Theoretically, yes. And yes, according to some scannists who laid out their money on the hope and promise. In actual practice, no. At least, not like you'd think or hope.

Yes, a properly designed preamp can make all the difference in the world, so long as it's mounted correctly and used with discretion. But that's the rub.

Preamplifiers are a lot like antennas, where performance can be utterly awesome over a narrow bandwidth. Specific uses for preamps include satellite monitoring where the signals are very weak in the first place. Satellite aficionados use antennas specifically designed for the bands of interest, and low noise, high gain preamps designed for those bands. That's the rub for the casual scannist.

A preamp designed for 30 MHz - 1300 MHz simply cannot perform well because it isn't and can't be optimized. It may have high gain, but it will also have high noise, resulting in little or no change in the overall Signal-to-Noise ratio, and sometimes even degraded!

There are a number of complex reasons for this, and we won't get into them in this FAQ. Your best bet is to avoid wasting your money on preamps until you have a specific application and are willing to make some compromises with your station setup and the convenience aspects.

Most scanners are designed for all the gain the front end can handle anyway, and the addition of a preamp will cause all sorts of havoc and consternation. For example, I had one fellow call me over to his station to demonstrate his hot-dawg preamp and how much it enhanced his station. Hah! In short order, we determined that he was hearing things that weren't really there. The preamp ruined the dynamic range and noise figure of his otherwise decent scanner, and allowed signals from other bands to come in as if they were on the displayed frequency.

BEWARE video and TV preamps! These animals are designed for strong signals in the first place, since TV pictures become noise-free (speckle-free) only with signals

approaching 1000-microvolts. Note that a scanner signal should be noise-free at 1-microvolt! TV and video preamps just don't deliver for the discerning scannist.

There may be exceptions. There always are..... If you have a well designed receiver with a hot front end and if you use a GaAsFET preamp, you may very well hear some signals better with it than without. You will also hear more pseudosignals and interference. So it pays to save your money until you know for sure what you're dealing with and how to apply more esoteric information than can be presented here.

==========
07: Can my scanner be tuned/adjusted for improved performance?

Perhaps, but probably not by you. Most scanners have a dozen or more internal adjustments, that if any one is mistweaked, the performance can be drastically degraded. DO NOT ADJUST ANYTHING unless you know what you are doing and have the proper equipment at the ready!

I have known some scannists to put their ear close to the speaker and then tweak things one way and another in hopes of getting signals to pop out of the noise. Forget about it; it ain't gonna happen; not unless something is wrong in the first place, but it will take a lot more than an ear to make any adjustment "right".

For one thing, the latest crop of scanners have fewer adjustments and those are very critical, usually computer tweaked at the factory. Unlike older equipment, modern adjustments don't drift out of "whack". They're good for the life of the scanner.

The last scanner I know of that had any drift and misadjustment problems was the legendary PRO-2004, a hybrid of old and new technologies with some factory errors thrown in for good measure. I can usually get better performance out of any PRO-2004 that comes across my bench, but this example is the exception to the rule.

Don't tweak your scanners unless you know how and have the right test equipment.

==========
08: What effect does an earth ground have on my station performance?

For above 30 MHz? None. Or nearly none, anyway. The farther below 30 MHz you go, the more effect grounding (or lack of) has on performance of the station. By and large, scannists ground their antennas and chassis of all equipment in the station for the sake of personal

safety and some protection against lightning.

Safety is enhanced in the event a 110-vac wire ever touches the chassis of the equipment because a fuse or circuit breaker will blow, thereby protecting the operator from shock.

Lightning protection is enhanced by virtue of Ohm's Law. Electrical damage is caused by the square of the current multiplied by the resistance of the path. Well, an ungrounded antenna might actually have a 50 ohm path to ground without you knowing it. So here comes a strike and 1000-amperes flow through that 50 ohms. Guess what? Fifty million watts of power is dissipated in a microsecond or two, with the effect of a monstrous flash-bang bomb and resultant terror and havoc.

Conversely, say you have a zero-ohm path to ground, thanks to good grounding, then that 1000-amperes times zero ohms equals zero watts. No damage!

Well, there is no such thing as a zero-ohm path to ground, but the lower the resistance to ground from the tip of the antenna, the less chance there is of damage to your station. A number of years ago, I had a 100-ft communications tower in Missouri where I saw lightning strike it many times. Never was there any damage to the station, even though one time I was on the microphone when a bolt hit. Balls of St. Elmo's Fire erupted out of the equipment rack and skittered over the desk to the floor where they danced around and dissipated. There were scorch marks across the surface of my desk, but the station equipment was unscathed!!!

When I finally took the station down to move to Colorado, I found where the coaxial cable wouldn't pull out of the tower. Curious, I followed it along its length and found several spots where surges had erupted through the outer insulation and welded the copper shields to the tower legs!!! The lightning had improved its own ground!! Some time later, I learned that professional installations purposefully grounded the shields of their coax cable at 10-ft or 20-ft intervals down the tower. Can you say I was a "believer"?

A "good" hobbyist grounding system consists of two or more 10-ft 1" dia copper water pipes driven into the ground. They "drive" fairly easily with the ground end sharpened somewhat and a cap placed over the driven end. I drill 1/8" holes at 6" intervals down the pipes so as to let me water the soil at regular intervals to keep conductivity high and resistance low.

NEVER ever use salt and other compounds or mixtures in a vain attempt to "improve" the ground. Any improvement will only be temporary until corrosion sets in. Corrosion is a high resistance to the point of even being a good insulator. You don't want that.

Copper water pipes are superior to normal ground rods by virtue of their diameter and cross-sectional area that contacts the soil. Contact area of a ground rod is equal to circumference of the rod multiplied by the length. The circumference of a 5/8" ground rod is 1.9635 inches whereas for a 1" copper pipe, it's 60% greater at 3.1416 inches. This means at least 60% lower resistance to earth!

The two or more pipes should be interconnected with #6 solid copper wire or 2" wide solid flat copper ribbon conductor. Mechanical clamping is preferable to soldering for reasons we'll not get into here.

A single #6 solid copper wire should enter the station by the most direct route with no sharp bends or kinks, and be ran along the length of the station desk or console in the rear. Then the chassis of each equipment can be connected to this copper bus by short lengths of #14 solid copper jumpers with alligator clips on one end instead of permanent connections. The other ends of the jumpers can go to case or chassis screws of each equipment to complete the station grounds.

A single #6 solid copper wire should also go from the ground rods up the tower or mast and be securely bolted to not only the mast, but also the grounded portion of the antenna mount.

This grounding system will not intrinsically protect you against the effects of lightning, (nothing will do that), but it can reduce chances of harm and damage. And in some cases, it can enhance performance of the station.

==========

09: What else affects the performance of my station?

That's it. I think we've covered it all in a nutshell.

Oh sure, you can find all sorts of goodies to add to the scanning post, but the things that distinguish the men from the boys are pretty much limited to: antennas; feedline; preamps (or lack of); a properly tuned and operated scanner; and a decent earth ground. The rest is incidental and subject to your unique interests and preferences.

I will suggest that computer automation offers the power
and the force to ease a lot of the drudgery so as to
free you up to attend to the antenna, feedline, and
earth ground details. A directional beam antenna
offers the added power of REJECTION to your arsenal for
pulling in those elusive, distant signals. Concluding
with the fact that there is no substitute for height of
the antenna, you really do have it all now, in terms of
what makes or breaks a radio station.

==========
10: What is a "decibel" (dB) and what does it mean?

A decibel is one-tenth of a bel, named after Alexander
Graham Bell, inventor of the telephone, and an early
pioneer in the study of power ratios. The "bel" unit is
rarely used now, but the "decibel" is as common as fleas
on a junkyard dog, so let's take a look into what it
means and how to use it.

A decibel is a ratio; nothing more; nothing less; an
expression of one power level to another.
Mathematically, the decibel is expressed as:

dB = 10 Log (P1/P2)

where: dB = decibels
Log = logarithm to the Base 10
P1 = the first level of power (watts)
P2 = the second level of power (watts)

For example, let's say that a power smplifier has a
1-watt input and a 10-watt output. What is the gain of
that amplifier in decidels?

dB = 10 Log (10/1)
= 10 Log 10
= 10 (1) {The logarithm of 10 in the Base 10 is "1"}
= 10 db Gain

As another example, suppose an antenna has 3 dB gain.
What is the ratio of the input signal to the output?
(Input is the free space wave power and Output is the
power into the coax.)

3 dB = 10 Log Pr (where Pr is the Power Ratio)
.3 = Log Pr (divided both sides by 10, so now we
know that 0.3 is the logarithm, so
next we take the antilog of 0.3)
10E(0.3) = 1.995 (10 raised to an
exponent of .3 = 1.995)

In this example, we find that 3 dB of gain is equal to a
ratio of double or "2" (rounded off). In fact, an

antenna with 3 dB gain doubles the signal power into the coax. Now let's look at one more:

Suppose we have an antenna with 6 dB gain. What is the ratio of the input signal to the output?

6 dB = 10 Log Pr (where Pr is the Power Ratio)
.6 = Log Pr (divided both sides by 10, so now we know that 0.6 is the logarithm, so next we take the antilog of 0.6)
10E(0.6) = 3.981 (10 raised to an exponent of .6 = 3.981)

In this example, we find that 6 dB of gain is equal to a ratio of quadruple or "4" (rounded off). In fact, an antenna with 6 dB gain quadruples the signal power into the coax.

Here we have established a powerful layman's rule of thumb for working with decibels. Every increment or change of 3 db is a factor of DOUBLE or ONE-HALF, depending on whether we're talking GAIN or LOSS. And 10 dB is a factor of TEN (gain) or ONE-TENTH (loss).

Say your coax has a 10 dB loss. That means down at the receiver, the signal is 10% of what it was at the input to the coax! If it has a 12 dB loss, then the signal at the receiver is 1/16 of the input. A 1 dB loss is about 20%. 2 dB loss is about 37%. 3 dB is a 50% loss. 6 dB is a 75% loss and 10 dB is a 90% loss. Get the picture? Nope, not yet you don't..... Read on, MacDuff.....

Polarity. There is a difference between +3 dB and -3 dB. The first is gain while the second is loss. OR IS IT? You have to be careful how you work, talk, and think with signed decibel numbers. Look, a -3 dB loss is really a +3 dB gain, and a +3 dB loss is really a -3 dB gain. Remember my amplifier example way up above? Well it had a +10 dB gain. What I didn't tell you there is that it also has a -10 dB loss. So it can get confusing, to say the least. But it needn't.

Suppose your net worth is ten bucks. Then your net obligations are exactly -$10. On the other hand, if your net worth is -$10, then you owe ten bucks. So a lot depends on how you express what you're talking about. By and large, we want to stick to talking about GAIN where a positive number means a multiplication and a negative number means a fraction. Usually, we talk GAIN in antennas and amplifiers, but we talk LOSS in coax cable, attenuators and radio paths. So you are going to see positive and negative numbers everywhere

when working with decibels. Get used to it. But there is some sense...

Ferinstance, say a 20-mile radio path has a loss of 120 dB. That's saying the same thing as a GAIN of -120 dB. Common sense says to refer to loss for things that normally have a loss. And refer to gain for things that normally have a multiplication factor. Antennas and amplifiers are usually multipliers.

In a word, "loss" almost always means LOSS. But GAIN can mean a multipler or a loss, depending. You'll quickly get used to it if you relate to money, net worth, and net obligations. It will make sense after a while. You'd ordinarily not say, "I'm worth -$10." It makes more sense to say you owe ten bucks. Likewise, you'd not usually say you owed -$10 when you are worth ten bucks.

==========

That's it for now. I will keep this FAQ updated. If you see things that need to be added to it, by all means, let me know. If this FAQ fails to address your question(s), then hit me with 'em, but be specific. And be detailed with symptoms and observations if you need tech support on mods or troubleshooting and diagnosis. Use e-mail if you can.

I exchanged e-mail with Bill the other day and he has no intention of becoming active on the newsgroups or listservers again. As a matter of fact, he's devoting his time these days to building up a computer business and has pretty much lost interest in scanning, except for one project I can't talk about.

I believe the FAQs from Bill are in some way sent to the newsgroup automatically once a month or so, and they don't indicate that he has returned.

While I agree that Bill did his part to keep the flame wars going, I do think that the information in those FAQs alone is a greater contribution to this newsgroup than any of his detractors have ever made.

That, at least, is worthwhile. Now learn a little about the 'net, as you apparently have about scanner monitoring, and perhaps you can avoid offending other system admins across the face of the globe.

It's "illegal" (or at least a violation of federal regulations) to operate
anything that emits more than certain levels of RF on certain frequencies.
It's more "illegal" if it interferes with a licensed RF transmission and
much more so if the interference is intentional and malicious.

I would suggest getting a Uniden Bearcat BC350A. It is a nice little unit for the price range you are looking for. I find that it works well as both a base and mobile. One thing I like most about it, is that it has few buttons and is easy to operate. For a first time scanner or cheap mobile rig, this unit works great. Of course it's not my favorite of my 5 scanners, but it does the trick and happens to be my only base/mobile. Here is a brief description of what is included:

telescoping antenna
suction cup window antenna
mobile mount kit
AC power cord
DC power cord
instruction book

Hold Key
Up Key
Down Key
Private Key
Fire/Emg Key
Air Key
Police Key
WX Key
Mrn Key
Search Key
L/O Key
Band Key
Prog Key
Sq Select dial
Volume/Off Select dial

You aren't alone in that feeling. I believe the major consummer
electronics manufacturers would like to keep you ignorant of the problems
of RFI. Nearly every product is sold with an instruction book and in the
front of each and every book is the warnings page. The various hazards
attendant to using their equipment are listed on this page(s). It would be
SO EASY to include warnings and possible solutions to RFI at the same time
but they don't. Wonder why? <Grin>

That pretty much says it all. I think few CB'ers are using 30 year old amplifiers and to my mind I tend to discount those old boxes. Heck I have 220 radios that can access the "lost" 2megs. I am not likely to use them but I don't think newer amateurs are able or willing to even bother buying these older 220 mhz rigs. The fact that some old boxs still exist is probably not germane to the discussion.

In the past I've seen postings indicating that you can special order a replacement keypad from RS. I don't know what's involved as far as installing it.

Another thing you are missing is triple conversion in the Pro-43 vs. double conversion on the '39.

I'm not really a sleezy person, but I wish I had thought of the 'gut switch' before! So simple. I wonder how often this has happened?

Hello,
I have a Trident Tr980 handheld scanner for sale. It has 125 channels 5 search banks and covers 5 - 1300 mhz with no gaps except for the cell phone frequencies, it receives AM,FM.and WFM. The radio is in like new condition without any modifications and includes original antenna,manual , battery holder (uses 4 AAA batteries),and ac adaptor. $100.00 + shipping
Thanks,
Bret bretb@iag.net

I doubt it.

First of all, there is no "free speech" obligation for a private association such as a condo or homeowners association. The First Amendment applies to governmental actions, not to private party or group actions. In othert words, I have no obligation to respect your "freedom of speech" unless I am acting in a govrenmental role.

Secondly, there is no such thing as a "PRB-1" Federal preemption invalidating amateur antenna restrictions imposed by private organizations such as condo or homeowners associations. There is preemption of local government zoning and permitting restrictions. There is preemption on both private and governmental restrictions on installation of TV receiving antennas and video receiving "dishes" but this preemption is specific and does not apply to those or other antennas when not installed solely for TV/video sqatellite reception.

Thirdly, knowing how Florida courts have been treating radio amateur tower matters, for instance, I would be very surprised if they would find in favor of the amateur as opposed to the condo association.

Finally, the leading case in the field of "amateur rights" (or more acuurately lack of same) is Howard v City of Burlingame, a case from California heard in the U S Court of Appeals for the Ninth Circuit (the next level below the U S Supreme Court). Uncle Vern tried to sue the City asking for money damages for violating his "civil rights" and First Amendment Free Speech rights in denying him an antenna permit. The Court held that there are no such rights conferred by the holding of an amateur license, and therefore no damages could be awarded.

This case is the only case that has dealt with "rights" per se. It has not been contradicted or overruled by any other case in

the country.

> As manager of an EMC/EMI testing lab,

The you can certainly understand that making the measurment is
the easy part. Interpreting it is the more difficult task.

> I can guarantee that a vehicle
> parked randomly near a radiating antenna in a typical neighborhood would
> not be able to measure within 10 db accuracy of the radiated power
> ,assuming his
> antennae and measuring apparatus had zero error.

The question of compliance is transmitter power level, not
field strength, ERP or IERP as in EMC measurments.

The measurment of transmitter power is not made by observing
the absolute field strength and working it backwards through
antenna gain factors, although most experienced FCC agents can
usually make a good educated guess from the signal level and
spectral purity as to whether the station is in compliance or
not just from the before-inspection measurment described below.
You can't replace experience with instruments.

As described above, the transmitted signal level as observed on
a spectrum analyzer is first noted before inspection. Without
disturbing the receiving vehicle, equipment or antenna, an
inspection is made where the station transmits and the output
power is measured by the direct method (antenna line measurments).
The received signal level is noted by the agent left behind to
verify that the receiving equipment and the observed orientation
of the antenna are not changed prior to the second measurment.
The relative change in signal level, expressed in dB, is applied
to the measured power to determine the original transmitter power.

There are specific "fudge factors" that are cranked in to cover anomalies, usually in the station's favor.

This method is the accepted method for overpower enforcement purposes and has withstood several challenges, some of which I have had to defend against.

Additional factors involved in determination of compliance which are not easily measured by instruments are the amount of time the inspecting agent is kept at the door, the hard-to-hide characteristic "tinkle" of PL-259 coax connectors being undone in a hurry, the presence of a dust-free empty warm spot on the otherwise jammed operating table, and the attitude and cooperation (or lack thereof) of the operator involved.

As the original poster said - there's no magic to this. It's experience, not rocket science.

All the newer scanners sold in the USA were designed NOT to be
able to receive cellular. It no longer is a case of a radio designed
to pick up these frequencies but was modified by the manufacturer
not to do so. So...since the PRO-90 wasn't designed for it, there's
nothing to restore. Plenty of older ones out there though, just check
www.ebay.com

Though I haven't actually fixed a PRO-39 keypad, I have cleaned
many other products with this style keypad. It is usually a rubber
membrane that gets a little dirty on the backside (hate when that
happens!). Open up the scanner and remove the key pad. Gently
clean the back of it and the contacts the membrane comes in
contact with by using Isopropyl Alcohol and swabs. That usually
does it.

From: Jim <kd6dx@yahoo.com>
Message-ID: <7303bv$io4$1@news.ncal.verio.com>
Source record: 137568

I just purchased a new Optoelectronics Xplorer near field test
receiver which they say sweeps through the entire frequency
band from 30MHz to 2GHz in less than 1 second.

So far it does exactly what they say it does.

I bought it for transmitter hunting (foxhunting), close-in transmitters,
say within a few hundred feet. I will be testing it this weekend and
let everyone know what I find out.

Is there anyone else out there that owns or plans on owning an
Optoelectronics Xplorer?

What other things can this Xplorer do, or what do other Xplorer
user do with their Xplorer?

I've NEVER read of a case like this, sounds like an urban legend.
What I HAVE heard is cases that on the SURFACE sound like
this, but when you read the details you see that the case had a
LOT more criteria. Usually these cases are won when the
association tries to stop a HAM but turned a blind eye to others
putting up TV and FM antennas or CB. Once they allow one thing
they can't suddenly come back and decide to enforce on just
the HAM, and even if they come back and try to enforce it on
everybody, they might loose.

I live in a city environment and the ONLY time that intermod is a problem on my Yupi9000m is with a large antenna.

BUT I rarely need a big antenna because the Yupi can really pull in the weak signals even with a smaller one. I really like the ratt shack telescopic whip. For about $10.

Hi David,
First of all, you have to check if you use the discriminator output
of your scanner. POC32 doesn't work if you plug the audio output
to your soundcard.
May be you have to check too the record level in the control panel
Hope this helps
regards

Another side to the "intermod" problem with the yupi is that it is due primarily to the extremely SENSATIVE receiver.

Now... if sensativity is a problem try using a $5 adjustable attenuator from ratt shack... or better yet try an antenna tuner. If you scan below 150 Mhz and own a Yupi... you are LOSING OUT if you dont own a tuner. My cheapo Heathkit tuner is supposed to be for 2Mhz to 30Mhz but works GREAT up to 150Mhz.... Don't know why. The tuner does not seem to affect signal strength... just reduces interference and intermod... TRY IT! Anyone who owns a wider range scanner will be amazed.

/RULE 8 - Antenna Height
{A} "Antenna" means the radiating system (for transmitting, receiving or both) and the structure holding it up (tower, pole or mast). It also means everything else attached to the radiating system and the structure.
{B} If your antenna is mounted on a hand-held portable unit, none of the following limitations apply;
{C} If your antenna is installed at a fixed location (whether receiving, transmitting or both) it must comply with EITHER one of the following:
[1] The highest point must not be more than 20 feet (6.10 meters) higher than the highest point of the building or tree on which it is mounted;
or
[2] The highest point must not be more than 60 feet (18.3 meters) above the ground.
{D} If your CB station is located near an airport, and if your antenna structure is more than 20 feet (6.10 meters) high, you may have to obey additional restrictions. The highest point of your antenna must not exceed 39.37 inches (1 meter) above the airport elevation for every 109.36 yards (100 meters, 1 hectometer) of distance from the nearest point of the nearest airport runway. Differences in ground elevation between your antenna and the airport runway may complicate this formula. If your CB station is near an airport, you may contact the nearest FCC field office for a worksheet to help you figure the maximum allowable height for your antenna.
WARNING: Installation and removal of CB station antennas near powerlines is dangerous. For your safety follow the installation directions included with your antenna.

hello
i just get a AOR AR2700 and i have two little problems
1)is another way to reset the processor except when pressing the [pwr]
key and the [clr] key when torn the scanner on ?????
2)when i press the [2ndf]key and [up] and then the [ent]key ,according
to the manual the scanner switch to SEND-RECIVE mode,my scanner
doesn't do that,in stead switch back to regular scanning mood .
Now what i am doing wrong ,
please someone help me
thanks

5162. Re: ### Icom IC-R2?

Newsgroup: rec.radio.scanner
Date: 1998-11-18 00:00:00 UTC
From: F a b r i z i o <AvStrien@usa.net>
Message-ID: <72u4hn$3pi$1@newnews.nl.uu.net>
Source record: 137594

To be honest: I own IC-R2 and AOR AR-8200 (plus some
others; just can't leave them untouched ;>) and consider
selling AR-8200. Standing next to each other, IC-R2 opens
the squelch with an S9-reading, crisp and clear, where the
AOR AR-8200 only flutters with a singls 'S' but no single
dash beside it, for the same frequency. Also, my Yupiterus
MVT-7100 and MVT-9000 open with a maximum S-level
reading, so the bug is inside the AOR. This was noticed
for signals around 440 Mhz (70 cm-NFM), 600 Mhz (TV-WFM)
and 915 Mhz (European cellular-NFM).

Only frequencies down in the 4m band (70 - 86 Mhz) are better
received with AOR than any of the other receivers, and of
course the top-mount AM antenna delivers good MW reception.

All the AOR features and abundant text fields, search band
linkage, 40 search bands, 1010 channels plus 2050 pass
memories together cannot convince me that AOR "did it
again". When I go where the action is, my IC-R2s or the
good old Yupiteru MVT-7100 scanners are the devices I
always take with me. The AOR AR-8200 just too often misses
a transmission, especially during scan and search. It checks
active channels (I know from my IC-R2 they are active) and
the AOR just passes them.

In places where intermod misleads my scanner to open the
squelch, IC-R2's built-in CTCSS nicely keeps the squelch
closed. Brilliant !

400 channels are not that much (though it is twice as much
as the 200 on the Q-7A handy), but (yes, I must admit) that
was solved by purchasing a second one ... this is still
cheaper than one single AR-8200, and together they run
on one pack of 4 NiCads, like one single AR-8200 ;>)

BTW, talking on batteries: AOR can, during scan and
search, be used as a heater, batteries get cooking hot and
are, depending on what you do, flat in 1-4 hours. My IC-R2
on just 2 same brand new alkaline penlites runs 6-8 hours.

The IC-R2 is, despite the absence of a digits keyboard,
pretty easy to operate as a receiver (using it as a scanner
to start and stop scanning or searching is a 2-hand
operation, which may be experienced as a burden,
to be honest).

All in all, and to summarize: Outdoor action: IC-R2s are
my companion, at home my dependable resources are
Yupiteru MVT-7100 and MVT-9000 (as well as the veteran
base set AOR AR-3000, that's why AOR still has good
credit with me), but the AR-8200 is due to be sold.

Good luck with your IC-R2. Go for it! Fabrizio

Lee Rothman wrote in message ...
| Well, if the R2 is anything like the Q-7A, which from all those in the
| know tell me it is, after owning one for a little over a month, I must
| say it will be possibly a "best buy" for size, and for performance.
The
| sensitivity and lack of intermod was more than admirable, and the
audio
| will blow you away for the size, or for that matter, any size of
scanner.
| If I didn't have my 8200, I would say absolutely "BUY IT".

There's not much too it really. You buy a cable or build your own.
Plug into BC895 & plug into PC.

Download any number of demos available on the web and try them
out. Some are freeware, some are not. Decide which you like the
best and go with it! Many places that carry the BC895 software
will also carry the cable (prices vary and some will give a
discount if you buy both cable and software together).

For some reference help, try my Software page:

http://www.strongsignals.net/htm/software.htm

Good luck!

I think the R2 goes a little beyond the Q7. It's not as prone to
overload and covers HF which the Q7 doesn't do out of the box.

And, as another poster pointed out, the R2 is not yet available
in the US.

> to use my electronics without hearing my neighbor added insult to injury.

Well, while his attitude may have been less than accomodating, that is basically the way it is. A radio operator is obligated to ensure that his station is within the rules, and technical requirements for the radio service that he is part of. Once he can prove that his station is clean, there is very little else that he can do to eliminate the problem (Other than not transmitting at all). The fact that his fundamental signal is overloading your equipment is most likely the fault of the consumer electronics manufacturer's inadequate design. The FCC web page lists telephone equipment that has been tested and found to be "RF resistant". They haven't gone beyond that though. It's tough to test every product.

Some hams offer to purchase the filters to try to help their problem (They're not THAT expensive), but they hesitate to modify or work on neighbor's equipment due to the eventual liability issue. If anyhting happens to the equipment, at any time in the future, it will be blamed on the ham's work, and another hassle will be born.

>
> Frankly, my attitude at the time was, "Keep your *@#! radio waves off my property." If this happened again, I'd just hire an attorney.
>
> kathleen

I don't know what an attorney could do. You are now opening the can of worms over who's rights have priority over another's, and the method for determining that. It is currently not possible to completely block his RF from your property. There is no god given right to the enjoyment of interference free TV.

Put yourself in his shoes for a moment, what if something YOU enjoyed greatly, annoyed someone else, through no direct fault of your own, and they demanded that YOU stop your activity, so that they could enjoy theirs? How would it make you feel? After all the time, and money you have invested in your hobby, and all the friends that you've made over the years.

I read a case in Florida, where a condo association tried to prevent a ham from erecting an antenna. The ham sued the association using the grounds that they were violating his 1st amendment rights, by preventing him from communicating with his lifelong friends, among other things. I believe that he won the case.

This is interesting. I have heard about the inconsistencies in the 8200. I have compared it right next to the other scanners in the house, the RELM HS200 and ICOM PCR1000. The Relm is comparable to the Yupi as they make it. It's sensitivity was virtually dead on with the Relm, not better mind you, just as good. So oh well, I guess you got a weaker one that wasn't tweaked at the factory properly. This is simply not a global issue. The sensitivity of the 8200 is actually exceptional in the 30-50, 400-500, and 800-900mhz range. It even does an admirable job in the HF region at night in particular and I was told it was supposed to be deaf there. Go figure!

I have spent hundreds of dollars in search of the ultimate portable antenna and I have found that you can't beat the performance of that 10 dollar Radio Shack whip antenna with the coil in the center. It rules in the 30-50mhz range and also works best in the 400-479 and 800-900mhz range.

Geez dude. The post was asking about the Pro-26 not the AOR. You are really on a AOR8200 bashing mission. You obviously got a bad one as I don't have the problems you discuss. Was I just lucky or what?

****

As manager of an EMC/EMI testing lab, I can guarantee that a vehicle
parked randomly near a radiating antenna in a typical neighborhood would
not be able to measure within 10 db accuracy of the radiated power
,assuming his
antennae and measuring apparatus had zero error. The reflections and
convolutions of the radiated field limit the accuracy. That's why we
spend several
hundred thousand dollars to get a football field sized range calibrated
to less than 2 db. It's a lot of trouble.

You can prove this to yourself by sticking an antenna out the window of
your car and driving around the block, recording the readings. The
variation
which you measure is solely a result of
reflections/conductivity/blockages.
It will be greated than 20-30 db, just maintaining a relatively constant

distance from the radiator.

Scanner for sale :

Radio Shack PRO-67 200-Channel Portable Scanner - Good condition

o Triple Frequency Conversion
o Limit or Direct Frequency Search
o Service Bank Search
o Ten Channel-Storage banks - lets you store 20 channels in each bank
o Two-Second Scan Delay
o Memory Backup
o Lockout Function
o 10 Priority Channel
o 10 Monitor Memories
o Search Skip
o Hypersearch
o Data Signal Skip
o Backlight, battery low alert, Battery Save feature
o Built-in charger to charge rechargable batteries when adapter is
used
o Keylock

Reception ranges :
29 - 54 MHz
108 - 136.975 MHz
137 - 174 MHz
406 - 512 MHz
806 - 823.9375 MHz
851 - 868.9375 MHz
896.1125 - 1000 MHz

Still under extended warranty . expires 05/26/2001

Comes with box, manual, antenna. Everything in excellent condition.

Asking : $185 (CAN) or best offer.

Please reply in email or thread if interested. Will deliver for free
in Mississauga and the GTA.

Some information may not be applicable in all cases, in all countries
or in all instances. YMMV.

==========
e. UHF Telephones
==========
The channel allocations are fairly new, so you may not hear a lot of
activity yet. Some of the phones may use scrambled/encrypted or
digital technology, in which case your scanner will pick up nothing,
or nothing but noise. Still, it never hurts to try. That's
apparently what happens when you're listening and hear only one side
of the conversation, but when it changes cells you will hear a burst
from the other voice. That person may be using a digital cellular
phone.

The handset frequencies are 24.000 MHz higher. As always, you will
hear both sides of the conversation on the base frequency.

Panasonic telephone base units

Ch. Freq. Ch. Freq. Ch. Freq. Ch. Freq.

Of course you don't ... you know only what you see, not
necessarily what everybody else sees (how can you?) ...

>=A0 My fonts must be =
>set differently than everybody else's.

It's not your fonts, it's your mail program and the control
characters inline ... we're seeing control characters (i.e.,
newline/enter, etc.) appearing as such things as "=" and
"=A0" and others; some of these may screw up others' browser
displays, much as your Tesla coil "cure" screwed up your
neighbors' electronics ...

Sony has only distributed the SC1 in the US. Last I heard, 6-8 weeks
ago, dealers in Europe were trying to convince Sony Japan to give
them a CE model. We'll see...

>So... what are other people's experiences with ICOM -- do they return
>"pre-blocked" receivers with "blocks?" What about independent operators?

You get back what you send.

None of the service facilities has time to mess with crap like blocked
or unblocked. There are no restrictions on owning full coverage
receivers, just selling them new or importing them.

The R7100 has some known problems with bad FETs in the VCO. It is a
nasty repair. There are two bad ones that sooner or later will fail in
most R7100s especially if they are racked and stacked generating heat.
It was a design problem which ICOM knew about but never rectified.

We have replacement better spec FETs in stock, have experience with
maybe 100 of these receivers and can service the thing. Email me
direct if interested.

R7100 was not all that wonderful of a receiver. R7000 was better,
R8500 is much better.

Simple enough, CBer's who run high power invaribly transmit as much
of-frequency trash as they do on-frequency signals. Much of this trash is on
frequencies that ARE properly being responded to by TV's, VCR's etc. The result
of the JUNK that CB'ers are sold by the profiteers who also convince them a 2540
watt dirty amp ia s full kW.

> A bit of a double standard don't you think.

No, I *DON'T* think, I KNOW not.

> I have been saying for
> years it is usually the TV's fault but that doesn't seem to work unless it
> is a Ham that is creating the problem.

When CBers operate legally, that can be correct. Most of the time the CBers who
cause this TVI/RFI simply aren't operating legally, although many evidently
don't know what *legal* is.

> Don't get me wrong I would have gone
> about correcting the problem a different way. BTW Bill at least you do
> admit that Hams do indulge in illegal activities from time to time just like
> CB'ers.

Those hams that are found operating illegal CB stations are just at guilty as if
they were not hams. Some hams posting here have admitted to operating Freeband.
Why any ham would jeopardize their ham license by engaging in that sort of
activity is mysterious. Evidently they care little for their ham radio licenses
and activities.

I've heard a lot of people say the Yupiteru is great, but I wonder if the people who say this say it because they live in sparse areas considering this scanner can have interference in cities. Do you guys live in sparse areas or do you live in cities? If you live in cities do you think you don't get the interference because you live far enough away from the center of the city? I live like 5 miles away from Manhattan in a residential area.

5204. ### Icom IC-R2?

Browsed thru the newsgroup, and couldn't find anything about the Icom IC-R2.

Does anyone have any experience/opinions/views about it?

The only write up I could find was on "http://www.strongsignals.net/htm/revr2.htm" (Rich Wells, N2MCA).

Would like details if you know of any magazine that did a review on it, was considering getting one of these beasts...

Ed.

PS: How much do they retail for in the US and other parts of the world anyway?

I tried various types of clip-on mono earphones without success --
they never stayed in or on my ear.

I finally gave up and bought Sony Fontopia earbuds. They stay put and
the sound is amazing. Get a mono/stereo adapter plug and you can get
it in both ears.

I have a Pro-39 that has a funky keypad. Some keys like to work sometime, and sometimes not. Mostly the "1" and the "3". Is there a fix for this? And is it a common problem?

Side note: watch what you get when you buy scanners. I bought my Pro-39 at a pawn shop. I actually bought a Pro-43, but when I took it apart to mod it, it turned out to be a Pro-39! Someone must have bought a Pro-43 from RS, swapped the guts, and returned it! I only miss something in 400 mhz, so it's not that big a deal.

Thanks, James

Well, guys, be careful. The AOR AR-8200 has nice and
nifty features, maybe some 2 times as much features
as the Yupiteru MVT-9000, and some 3 times as much
as the Yupiteru MVT-7100, but when it comes to the
core of scanning, all a scanner should be able to is pick
up transmissions, pass them when on-air, and continue
with scanning, searching or waiting in silence. If that is
what you need, no single device comes close to the
good old Yupiteru MVT-7100. Less intermodulation than
the MVT-9000, same selectivity, good sensitivity ...

When it comes down to the basics, the veteran 7100
is still unbeaten. Even in RF-crowded areas you may
still have good results, unless you wish to receive weak
signals close to strong intermod and mirror frequencies
(in that case the attenuator is more or less useless).

Good luck, and if you can wait (and in the mean time
collect some money): wait for Yupiteru's new one due
somewhere in 2nd quarter '99 (rumors say Feb '99,
but we have had rumors on Yupi before ...)

Brgds, Fabrizio

Lee Rothman wrote in message ...
|You have a real acid test for a scanner. I live in Salt Lake City about
|that same distance from downtown, but the transmitters are mostly on
the
|mountain tops. I get little or no intermod from a competent scanner.
The
|Yupi's are by and large the most sensitive scanners made without most
of
|the intermod problems that plague most others. I did however opt for a
|AR8200 over the Yupiteru 9000 for it's computer interface. As soon as

When tuning to a TV station audio on my Yupi MVT-7100,
the signal is very strong.

The problem is that the audio sounds so "strong" it sounds like crap.
It sounds "crackly". Is the term "overmodulated?

Anyway, what can I do to make it sound better?
I tried the attenuator, but it didn't help.

ALSO...
When tuning to local radio stations, I don't hear any thing. Why?

Mike

I'm sure this has been addressed but here goes; if you have a scanner that receives cellular frequencies, can you lock on a phone, say, that is beside you at a traffic light? And if you could, could you stay on that frequency/tramission as long as you were very close by and continue to hear that conversation or would the freq jump from cell to cell. And before all ye righteous blast about the interception of cell/cordless/ ecpa stuff, just remember, I know its illegal!! I just want to know how it works in theory, is it possible to follow one conversation if you are very close to the transmitting phone?

It almost sounds more like you are tuning with the wrong frequency
spacing for that band. This certainly will cause a rather distorted audio
as the Yupi has great audio.

With all due respect, that's the same (no more recent than
1995) Don Stoner material that I have been seeing there for
years. Tower restrictions, both writing them and fighting
them, is one of the "niches" of my legal practice, as is
advising both Licensees and Homeowner/Condo Associations "when
to hold 'em, when to fold 'em".

I can find nothing in the material on that web page that shows
that the case ever went to suit (i.e. court) and that a court
ruled that there were enforceable "civil rights" or "free
speech rights". Mediation/arbitration does not constitute a
lawsuit.

Is there a different place that you want me to look?

> > First of all, there is no "free speech" obligation for a

If the Association backed down, it is a victory for the
antenna owner, but does not in any manner establish any
citeable law or precedent for use in any other situation.

> > Secondly, there is no such thing as a "PRB-1" Federal

>
> But it DOES shed some grey in the area of "Unsightly antenna aesthetics"
> issues, and one could make a case, that if a TV antenna is deemed
> acceptable, then why not an equivilently sized ham antenna?

That's because the preemption for TV/video antennas is not
based on aesthetics, but is based on the Congressionally-mandated
policy that all such services shall be made available to all
viewers without distinction. There is no such parallel for ham
radio. The FCC has been reluctant to impose any more antenna
preemptions unless there is a Congressional mandate to do so.

Ths issue of aesthetics, BTW, is preemptable in a PRB-1
situation (local/state zoning, permitting, or ordinance). Some
states have extended this type of preemption to private
covenants. Others have not, and procedures vary from stste to
state. In California, state law provides that a retriction is
presumed reasonable unless it can be shown otherwise, i.e. the
burden is on the ham antenna owner to show that the restriction
is unreasonable, not on the Association to show that the
restriction is reasonable.

The guy who got me started in the field of antenna law, Ed
Peck, K6AN, a now-deceased prominent amateur and attorney,
taught me the first lesson of aesthetic challenges some 30
years ago. When I consulted him about the validity of a
restriction that said "No antennas of an unsightly nature may
be erected", he replied "Antennas are works of art. Go ahead
and put it up."

The best weapon against aesthtic challenges is preemption of
such challenges, otherwise you are arguing "how up is up".

> Issues of
> selective enforcement and other double standards rise to the top of the
> sludge.

Selective enforcement requires that the different individuals
are doing the same offense. This is not the case here. A TV
antenna =/= a ham antenna.

Unless one can show an improper personal agenda or so-called
"unlawful discrimination", i.e. based on race, religuion, etc,
targeting the individual, there is nothing wrong with selective

enforcement.

> > Finally, the leading case in the field of "amateur rights" (or

> > license, and therefore no damages could be awarded.
> >
> Not surprizing in the liberal thinking state of California, where
> individual rights are often disregarded for the sake of the group with
> the most political influence.

The decision came from the U S Court of Appeals for the Ninth Circuit, a Federal court, not a California court. Judges in that cour are drawn from such "liberal thinking" states as Idaho, Alaska, Arizona, Nevada and Washington, as well as Hawaii, Oregon, and California.

"Liberal thinking", at least with my 1960s definition of "liberal", would have conferred rights on the individual whether such rights existed or not, creating them as necessary.

The Ninth Circuit's decision was based on a careful reading of the legislative intent of The Congress in granting the FCC authority to issue amateur license and the rights and privileges to be conferred and not to be conferred thereby.

Because the U S Supreme Court has not overruled this case and there is no other case in any other Circuit that is at odds with this finding, it is binding authority in the Ninth Circuit states and persuasive authority in all other Circuits and states. That means that unless a (Federal) Circuit court in some other Circuit wants to rule otherwise, it remains "good law".

First off you could only hear one side of the conversation as cellular phones are full duplex transmission, meaniing they transmit and recieve at the same time on different freqs. Normally the phone would remain on the same channel until handed off by the system to another cell site, then the channel could any of hundreds.

It could possibly have been as a result of what is called Meteor scatter.
This is the random and unpredectable reflection of radio waves from the
surface of meteors as they pass through the earth's atmosphere. In Amateur
radio guys try to make use of this scatter to make previously impossible
contacts.

Dick,

All I can tell you is that these were advertised
as CB amps and have a type acceptance sticker on
them, which is why I saved them. I figured they
may either come in handy some day in court, or may
become collector's items.

Don't exactly know where the thread started out, anyway...

Dennis,

Just because a device has a Type Accepted sticker on it, does not mean it is Type Accepted for what it is advertized for.

As Mr. Carrol points out, the amps are probably legal for business band, or some other legal use.

You can look up the Type Acceptance #, to find out what the device IS legal for.

The highest power ever allowed for "CB", was Class A (UHF FM), now known as GMRS. It allows 50 watts at the antenna port of a Fixed Base station/repeater. Class D is as Mr. Carroll explained. Always was from the beginning.

However, there is some minor loophole in the Class D CB band, that does allow for higher power 25 Watts Carrier, but as I recall, it was not a voice mode, nor was it for common everyday communications.

Enjoy!

the freq. will most likely jump from cell to cell. look at this website
http://www.inetone.net/Fsmith/index.html
and check out the link to cellular towers for the layout. this might explain
what you are looking for.
also with a freq. counter like from RS usually will give you the phone freq.
up to about 30 feet. not much but for those who are llegal to listen to that
stuff if you just add 45Mhz to that counter you can get the tower and both
side (depending on the phone and cellular system) of the conversation.

Hi All,
I have a NEW Pro-2041 For Sale, 400 Channel, 12V / 110 VAC
Scanner. It is NEW, 1 1/2 weeks old. I bought two and found I only
need one. So I am going to sell one. Comes with Book, Box, Antenna
and sales slip.

$125.00 Plus Shipping

Reply to: boyd@humboldt1.com

Thanks,
Boyd

It's one of the simplest pc-radio programs to install. The setup program is on the CD and it detects the radio immediately. Nothing else to buy. As a pilot, I have a Sony Air8 which is the best airband radios I've ever owned, but this radio has performed better than the Air8. The computer program is excellent!

Hi all,

The BNC connector on my scanner is starting to wear and the antenna is getting loose. Has anyone else had this problem? If so how did you fix it. I want to replace the connector, but I have been unable to find one that will fit.
I've checked the Radio Shack chassie mount BNC connector, but it is too long.
Does anyone know the part # (and company) of one that will fit without modification?

Thanks,
Jamie

"Rob Corbett" <corbett@inch.com> asked for:
> ... the frequencie(s) for the Radio Shack Personal FM Transceiver
> - Catalog# 21-1802 FCC ID# AA021-1802

FRS Ch 1, 462.5625 MHz (ref: p.56 of the R.S. catalog).

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

FRS - Family Radio Service [95.627]

Ch Freq Ch Freq

1 462.5625 8 467.5625
2 462.5875 9 467.5875
3 462.6125 10 467.6125
4 462.6375 11 467.6375
5 462.6625 12 467.6625
6 462.6875 13 467.6875
7 462.7125 14 467.7125

The FRS was authorized on 06 June 96. It uses FM with a peak
deviation of +/- 2.5 kHz. Maximum power is 0.5w ERP.
Channels 1 - 7 are shared with GMRS.

Really? They skip their signal off them? That's pretty cool. Probably no-one else on earth has figured out a use for those meteor showers. But leave it to the hams.

Pretty neat. "This transmission is coming to you courtesy of stellar dirtclods zipping through our atmosphere!" Too cool.

Actually thats not true!!

<NOTE!> In Canada scanning cell phones is completely
legal given that you do not pass on data to third parties or profit from
what you hear....

Anyways, since I scan cell phones quite a bit, I can tell you most of the
time you can actually hear BOTH sides of the conversations, because
cell towers tend to echo back the reverse channel, however it should
be said that the forward channel of the conversation is usually strongest
(that is the channel that actually gets Xmitted to the cell phones, not the
signals that the cell phone transmits which is the reverse channel)

If one were to use the optoelectronics Scout inconjunction with a
European AR8200, you could camp on a cell phone conversation if it
is the only radio emitting device close you (if one were closer, the scout
would tune to it)...

Just wanted to say that up here in Canada cell scanning is usually quite
entertaining because you USUALLY hear both sides of the conversation..

Happy scanning!!

Mike

The best pre amp that I could recommend would be by a company called "Palomar". They are in Escondido California I think. I had one and it didn't suffer from the intermod problems the Grove one that I had did because it was also a "preselector". While it didn't cover the entire Vhf-Uhf area, it did incredible things up to 50mhz. They may even have something more suitable at this time for the higher frequencies. Check out Universal Radio or some equivalent place as that is where I once got it, or I know you can buy it direct if you contact the company and even get a full catalog. Good Luck.

5262. Signal Preamps for Scanners

Newsgroup: rec.radio.scanner
Date: 1998-11-19 00:00:00 UTC
From: talkyal@aol.com
Message-ID: <19981118220801.03043.00003511@ng68.aol.com>
Source record: 137482

On page 75 of the 1999 Radio Shack catalog,
there is a signal preamp for handheld scanners
RSU 10456150 $64.99, and a signal preamp
for base scanners RSU 10456143 $74.99.
Are these signal preamps worth spending
70 bucks for, or do they just amplify noise ???

talkyal

>much more so if the interference is intentional and malicious.

Remember that part15 sticker about accepting interference but not generating any? I don't see any such sticker on my homebuilt tesla coil! I've never seen any law regarding the construction of tesla coils, ever! If I chose to build a 15 foot job in my backyard to experiment with high frequency power the fcc will come and use their typical nazi tactics to remove or disable it like a 1watt WFM pirate? Hmmmm, I doubt it? Neighbors maybe...but the fcc? They have yet to stop the moron running 3KW on 11 meters in my neighborhood.

No special ones, although:

-Enter and 2 while turning on will toggle keypad beep.
-Enter and 3 while turning on will enable the PC programming function.

I like the scanner - except the speaker distorts at 50% volume, and the
display is hard to read if looking at it from above.

I don't know if ICF-SC1 has cellular coverage but in Europe,
we use GSM and DCS1800. Both are encrypted digital
communications.
The old Radiocom2000 analog service will be closed in a few.

That's because you didn't look in the correct location. Operation of your Tesla has to be in accordance with Title 47 CFR Part 15. The CFR collection can be found in the government documents section of your local library. Remember, ignorance of the law is no excuse.

The Ramsey unit only works on simple inversion scrambling....very FEW
police systems use this any more-and there is NO POSSIBLE way that the
Ramsey could decode a digital signal.

Hello,
I have the RSU 10456143. It is a GRE Super Amp.
Is it worth it? I have not made up my mind yet.
There are times where it does pull signals in out of the "blue". Other times it seems to amplify noise. I think this is frequency dependant but I am not sure. I use it with a Pro-26 and a BC 235 with a Discone Antenna on a 2nd story eave mount. Hope this helps.
Good listening

>Can someone tell me where I can buy a good case for the Yupiteru 7100?

Bandercom www.bander.com sells the case for $20. If you think that is too expensive, there's the Pouch, which sells for about $10-$12. It functions just as the name implies--it's made of neoprehene-something or other--very cushiony but no way to operate the scanner through the case. Ham Radio Outlet sells it as does a number of others.

Those amplifiers that you speak of were certified to be used within a frequency range that included 11 meters. They were also certified to be used on approved business or commercial bands only. There was usually a little side node that stated "not legal for class D Citizen's band". I think that you know that, and suspect that you are just having a little game with semantics...;)

Look for yourself:
http://www.gate.net/~donstone/s-v-440.html

> First of all, there is no "free speech" obligation for a
> private association such as a condo or homeowners association.
> The First Amendment applies to governmental actions, not to
> private party or group actions. In othert words, I have no
> obligation to respect your "freedom of speech" unless I am
> acting in a govrenmental role.

Then maybe the condo's legal team was not as brazen, but the threat of
legal action INCLUDING the free speech clause, was enough to get them to
back down. There were other grounds too.

>
> Secondly, there is no such thing as a "PRB-1" Federal

> antennas and video receiving "dishes" but this preemption is
> specific and does not apply to those or other antennas when not
> installed solely for TV/video sqatellite reception.

But it DOES shed some grey in the area of "Unsightly antenna aesthetics"
issues, and one could make a case, that if a TV antenna is deemed
acceptable, then why not an equivilently sized ham antenna? Issues of
selective enforcement and other double standards rise to the top of the
sludge.

>

Not surprizing in the liberal thinking state of California, where
individual rights are often disregarded for the sake of the group with
the most political influence.

This descrambler is used for analog speech inversion not for digital
communications. If your area is like mine, there are very few police
departments that utilize analog speech inversion. The only real useful
application for the Ramsey unit would be to listen to analog scrambled
cordless telephones, if thats your bag!!!

Has anyone ever used a signal amplifier in a mobile application, more specifically for the 800MHz band? If so, would you please share what equipment was used, it's configuration in your system, and your thoughts on how effective it was. I am installing new antenna on my truck for VHF/UHF and 800MHz. The 800MHz signals are weak in my area and won't allow the TT scanner to "lock in" continuously. Looking for a solution.

What do you base this conclusion upon? Where do you find
reference to 11M on your amps? A photo of such a reference
placed on a web site would be nice.

> Sorry Howard, but they were certified and LEGAL
>for use on the 11 meter band.

Again, prove your statement. Only if your amplifiers were manufactured
prior to 1958 could they be as you say.

Thanks for the feedback, I acually purchased one, and returned it for a Q7 the next day. (I didn't know the Q7 existed when I purchased it...)

Those interested: Main differences I could see between the R2 and Q7 (dual band amatuer transceiver) :

R2 has (and Q7 does not): 400 memories (Q7 200), built in attenuator, and coverage from 0.5-30

Rgds,

Ed.

I believe that our resident expert on FCC regs will confirm that there has never been a power level authorized for Class D citizens band beyond 5 watts, other than for SSB which as I remember was 12 watts PEP, all input. Any amplifier covering the 11 meter band which shows FCC type acceptance has either been modified from some other service or is displaying fictitious documentation.

5321. Cape Ops up on 9043 again. Boeing-KSC on 407.5250

Newsgroup: rec.radio.scanner
Date: 1998-11-20 00:00:00 UTC
From: allanstern@aol.com
Message-ID: <19981120170334.12311.00000565@ng149.aol.com>
Source record: 137333

At 4:29pm EST (1629z), Cape Operations was heard in comms concerning the Delta 2 rocket launch rescheduled for this evening. Cape Ops was heard: "On my mark, minus 120 minutes and counting; 5 4 3 2 1 Mark!"
Not to toss water on the probability of a launch tonight, but comms on the Boeing-KSC freq (407.5250) are discussing a problem of some kind: "The problem is not at this end; we are leaving the pad now."
Coast Guard support can be heard also: "BRC is your Bearing Range Coarse adjust and BRF is your Bearing Range Fine adjust. Turn the BRC knob all the way clockwise, then all the way counterclockwise, and leave it at the midpoint of the turn. Then use your BRF to adjust." Sounds like me toying with my FRG-7 last night.

Everything I read about or experimented with wont make the Pro-64/2041 do
anything but load frequencies.

Yesterday, while I was eating my lunch, I was listening to play-by-play of an incident involving a cattle truck on I-10 near Casa Grande, AZ.Some of the cattle got loose and ran around the freeway -- for the Highway patrol, it was all in a days work .... was interesting to listen to

I use a +2dB cell phone antenna with my BC895. I have a +5dB gain antenna at home, but I have found that running it mobile will saturate the scanner in urban areas. I think that an increased gain (within reason, as noted above) antenna will work far more reliably than a pre-amp.

>talkyal

I don't have the BCT-12 but I do travel Arizona and California freeways quite often and can tell you that the Chippies usually do leave the extenders on as they drive. My in-car scanner has more than paid for itself in avoided tickets.

Next time you drive on any California freeway, punch up 154.9050 MHz and you'll see what I mean.

Visual Foxpro! Scary....

I'm a professional programmer and I have trouble understanding how it works.. Not a program for the faint of heart....

I find MS-Access to be a much easier package to use and program for. (A plus for this guy, because he said he already has it.) He should just take a look at the Northwind Traders sample database, that provides a good start on how to build an application with Access.

Just my own opinion, so don't get upset with me, people....

From: slogan@northlink.com
Message-ID: <slogan-2011981833520001@pm1-9.northlink.com>
Source record: 137350

I have a full coverage AOR AR8000 in mint condition to sell. It comes with the following:

1) Scout jack

2) the AM filter mod

3) the cellular filter mod

4) leather case

5) vinyl case

6) wall charger (110 vac) & nicads

7) Descrambler Chip

8) CX 12 AR Computer Interface

with manuals, box, and stock antenna. The radio is in mint condition and shows no wear as its always been kept in a protective case. Originally a Javiation UK unit it has the US band-plan with unblocked frequencies and the mods were professionally done.

$500.00 plus shipping. Buyer to prepay, have lots of references

Thanks!

> you back into all of this action! "
Well that all depends. Is your municipality or county or the
neighboring municiplaity or county trunked? If not, then I would not
worry. Even if they were to go Trunked that does not mean that there
are not other things to momnitor even though they may not be as
exciting. Do certain companies, public or private have trunked
communications? If you want to monitor these and or city, county and/or
state Trunked Systems then you will need a Trunk Tracker. If the
systems near you or where you live you an Ericcsson system then there is
ap program on the web that will most likely work with the system(s).
You asked for advice. I hope that this helps

If Motorola had a commercial 800 trunked system in those towns, most likely that is what Nextel now uses. They often purchase Motorola systems instead of building new ones. If you plan to try and monitor them, almost all of the Nextel systems are digital transmissions, making trying to hear on a scanner usless.

Yeah Phil, I know what you mean! I have a friend whom I went to school with who only went to hear the schoolbells ring. He also doesn't read instructions and has a hard time trying to microwave popcorn. Those three sentence instructions confuse him--but he's happy when he finally hears the microwave bell ring!

Iridium... a Motorola effort. They have almost 100 satellites in low
orbits. With their phone you can 'call home'
from the middle of the Pacific Ocean in a sailing yacht.... and receive
calls if it is turned on. You literally
can call anywhere in the world FROM anywhere in the world...(if the
aggreements are in place with the local
dictator or despot!!) The concept is to have the FIRST anywhere in the
world telephone. When in cellular
coverage, Iridium phones convert to cellular mode. If new technology will
be developed....Motorola will
develop it!!

I planned on getting an AOR AR-8200 next week, but today I visited the Javiation site, where I plan on purchasing, and they have quite a disclaimer as to the rumors concerning the 8200 scanner - what's the deal here? Is this not the ultimate portable scanner? I hadn't heard any bad rumors until I went to the source. What's the reputation of the AR 8200 now? Sorry if this horse has already been rode, but I don't get to browse in here as much as I'd like to these days, and what I have read only alluded to it being a top-of-the-line item. What's the scoop here?? Should I buy? Is the shortwave reception any good? Is the 8000 better? I'd like to hear some opinions from owners. Thanks! :)

I have a like new, unblocked Icom PCR1000 with the DSP Module installed and all accessories, box and manuals included. I have seen a low price for this new without the DSP module @$400.00 and that was a blocked unit and a overseas price for an unblocked unit @$569.00. Also the DSP alone is $160.00. I am asking $500.00 for this unit. If you are seriously interested, you can email me at dcisive@earthlink.net

Iridium is nomially a dual mode phone, 800Mhz Analog, 900Mhz GSM. Sat
adapter is optional (at extra cost no doubt), not sure what it will
operate at, but i suspect a lot higher than 800/900Mhz.

I am not to sure how you would find out which feeq they are on excapt matching the conversation to the person talking. It would remain on one fewq for a while but it changes, and getting the actual PHONES transmission would be one sided and the incomming freq would be one sided. However, even on my scanner which has cell blocked out for the majority of 800, I can get (I believe this is how it works) some of the actual Cell freqs and listen to both sids of the conversation (either this or it is bouncing somehow) in the upper 800 band and lower 900 band which isn't blocked on my SC150.

Lamia wrote:
> Can anyone tell me if i can conect two or three scanners to the same
> antenna ???????

Yes, with a simple splitter. But this has two adverse side effects
1. Splitting a signal reduces its strength accordingly. If you
split it in two, each radio will only get half the strength
of the original. Not the best solution if you're trying to
hear the furthest or weakest signals.
2. Connected as such, the radios in question are now free to
introduce their own self-generated noise into each other. So
not only can a receiver have problems with its own internal
interference, it can have added interference from the
other connected radio(s).

If you're willing to live with these limitations, then go for
it. If not, you might want to think about the Multi-Couplers
offered by Stridsberg Engineering. They offer both HF and
UHF/VHF models. They come in 2 and 4 port configurations.
The basic models serve to split the signal but offer port
isolation to reduce/eliminate problem #2 above. The high
end models also offer amplification to minimize the signal
loss to the 2/4-way split (thus solving both problems).

Check out their web site:

http://www.stridsberg.com/

Good luck!

Yes, check that both the frequency and receive mode are set properly.
And be aware that not all TV freqs are aligned to the .750 spacing
listed for the audio freqs.

I just bought a pro-2041. I've seen a few sites on the net that have software to program the scanner via a serial port.

Can the serial port control do anything else besides load up freq's, like add delay, Lock out or change what memory it's tuned to.

Hello all...

Just a couple of questions re: trunker. Does anyone know of a
version modified to support the PROgramit scanner interface? And has anyone else
noticed a bug where when it reads the data channel and works out what
frequencies are used a couple of them dont seem to be correct.
I've had it following a conversation through a number of channels and then it's
handed off to a frequency thats dead, and this happens on most of the systems
i've had it listening to.

AH Ha! 27.255, was a shared channel, once upon a time, with the old business band. You were allowed to run (I belive, but memory is foggy) 25 watts if you were a licensed BUSINESS band user. The other channels, common, were what is now know as channels 24, 25, 26 and 27. Lafayette used to sell radios that were type accepted to be CB and business radios. (The HB-600 comes to mind). So theroetically, if you were a licensed CBer and business user, you could legally have that amp in line, but were only allowed to use it on the designated business channels.

It might be in the "Mother page", one level up, that Don put up. I do
remember reading that he was challenging his condo association, on many
grounds (As advised by his counsel), including voilation of his right of
free speech. I don't know, if they backed down, because of this or not.

But many association restrictions ARE! If they ban an antenna, on the grounds that they "detract from the appearance of the common grounds", but are forced to allow TV antennas as part of this ruling, then they can't very well use the "aesthetic arguement anymore.

> but is based on the Congressionally-mandated

Again a double standard. What you're in essence saying here, is that if I'm a "recognized minority", and every wrong done to me can be spin doctored into a case of race or gender discrimination, then I have a case? And if my "recongnized minority" neighbor, is successful in overturning a restriction, then why can't I use his precidence to elicit my own action? What about "ham discrimination"?

How can you say that there's nothing wrong with "selective enforcement"? Rules are meant to be universal, they should apply equally to everybody.

Dave

Anyone using a Uniden BCT-12 Highway
Information System ?
I'm thinking about buying one, but I heard
that police turn off their repeater systems
until they have to get out of their car
(that's hard to believe in the event of a
quick emergency, I would think it would
have to be kept on at all times).
Anyway, anyone out there using a BCT-12 ?

Hello

I have just finished a new AirNav's homepage section.
It is called 'Users Area' and is completely made by users: they
explain what equipment they are using, give tips to listen to the airband
in their part of the world, etc.
Contributions are starting to arrive: Australian section is
already there.
Visit it at:

http://www.airnavsystems.com/usre.html

Hope you find it useful.
I think it is a great help for airband enthusiasts.

Best regards, Andre Brandao

The practical limit of home station amplifier power may be estimated at
5 KW without significant rewiring of the home power circuits. In that
case, your ham neighbor's signal would have been less than 6dB different
than if he was running the legal power limit. It's unlikely that this
power difference would result in significant changes in RFI pickup.
Consequently, you've probably just attacked a legal hobbyist. What if
your sewing machine created interference for him while running on the
low bands? Should he conspire to destroy it?

We all tried that first. It didn't work.

> Question #1: Did you ever let the guy know that there was a problem?

Yes. He was quite unsympathetic. I offered to
schedule my watching a movie (since that was NOT a
frequent event) around his radio activities.
However, he said, "Well, I'm on from 7 p.m. until
1 a.m. during the week and most of the weekend."
Period. Wouldn't adjust. It was just too bad for
me. I wasn't the only one in the area affected by
this, but I was the worst affected as I was
physically the closest.

> Question #2: Have you ever been a guest on the Jerry Springer show?

hehehe! Nah, I wouldn't beat up on a man -
wouldn't have been a fair fight.

See also my other post about this guy. My error -
I assumed that people would understand I wouldn't
have harassed him if anything short of moving out
had worked. He was very pleasant but completely
uncooperative - not a good ambassador for fellow
hobbyists.

However, I didn't conspire to DESTROY his
equipment. I DID briefly interfere with him on
those occasions - once a week or so - when I
wanted to watch a movie on the VCR in the evening,
which was the only thing that was completely
unusable while he was transmitting. And I never
turned on that tesla coil just for fun.

I got used to my talking sewing machine (BTW, that
was my first experience of his RFI, and it scared
the crap out of me, as you might imagine). I
disconnected the VCR when I wanted to watch
regular TV - it seemed to amplify the RFI. When I
rented tapes, I watched them early Saturday
morning before he woke up, whenever possible.

I'd like to try and tell you what this situation
FELT like to me (and other close neighbors) with a
hypothetical, so perhaps you could put yourself in
my shoes. No, this is not the legal equivalent,
but play along, here, please. Imagine that there
is no noise ordinance. A well-amplified,
uncooperative reggae band moves in next door.
They're engaging in a legal activity that will
affect your quality of life and cause you to make
unforeseen adjustments in your normal daily
activities, possibly at some expense. Earmuffs?
Soundproofing? Moving out? Aggravating, huh?

Kathleen,

I do see your point, but your methods initially hit a nerve. I had assumed that your Tesla coil extension wire had been placed close enough to his antenna to damage the sensitive "front end" circuitry of his radio, and that was why he stopped operating. This is a very real possibility, since many solid-state radios have susceptable receivers (which are very expensive to repair). By the way, were the RFI voice signals coming from your TV...etc very distorted, or were they relatively clear? This would help to establish what modes of operation were causing the problem.

Curt Breneman
KC2EBP

(p.s. When I lived in an old New Haven, Ct home converted to apartments, I had downstairs neighbors who were very obnoxious concerning stereo noise late at night (severe floor thumping!). My apartment had access to the building circuit breaker box (and theirs didn't), so the problem was made to go away....)

The sewing machine "mumbled" but was obviously
voice, if that makes sense. It was loud, too.
The TV/VCR combination did this: screen had major
streaky snow, almost a white-out, and loud,
understandable voice.

I'm NOT good on distances at all, but I'd estimate
his radio was *at least* 50-75 feet - and probably
farther - from my TV.

When I turned on the tesla coil, which was inside
my house, my very close neighbor on the other side
experienced some little bit of snow and
soft-medium buzz on his TV, which was less than 30
feet from the coil (narrow house lots, but the
radio man was at the end of the cul-de-sac with a
bigger lot).

I do sincerely hope I didn't damage his equipment,
but thanks for the warning. Can I assume I didn't
damage him since he continued to transmit with no
"down time"? That never occurred to me.

BTW, would he have been emitting microwaves or
anything that could have damaged anyone else, or
himself? Please don't laugh (I'm not talking
"radio waves from space/thought control"). I
don't know much about this stuff. It's been real
educational - and probably the longest-running,

crossposted non-drug thread ever in alt.l-e <big grin>.

I've been using an ancient program called PFS: Professional File for my scanner frequency database. What I really like about this program is it's simplicity of use, and that it automatically indexes on the field you want, (such as frequency...) However, it is a DOS-based program (nothing really wrong with that,) but the real limiting factor is that it will only allow 59,000 records in a single database file. If a person wanted all of the records for a state in one database file, this program won't do it. I've tried MS: Access but can't seem to get the program to align the frequencies correctly. (it's dropping the trailing zeros) Any suggestions about a database program to get me up to date would be appreciated. Thanks!

So, Ken and Mark, why didn't you answer Genes' question about the install program? He stated openly that "... Everything is accessible on the CD, but the install program! " Obviously if you both had good experiences and were able to install the program, then you might know the name of the install routine. I think that's all Gene needs to be a "happy camper."

Gene, I don't have this particular radio so I can't help with the name of the file. Maybe someone else will recognize your dilemma and send you the name.
Dale

01: What is the best scanner money can buy?

02: Okay. so what is the best real scanner money can buy?

Contents
========

01: What is the best scanner money can buy?

Your question is not answerable as it's phrased,
because there are several classes of radios that are
loosely called "scanners". A list of those classes or
types is as follows:

A. World Class Receivers: arguably, this class of
receivers includes radios from Icom, Kenwood,
Yaesu, Alinco, Watkins-Johnson, and WiNRADiO. These
are receivers ONLY, but by virtue of their cost,
and/or excellence, and/or primary purpose, and/or
technical design, and/or limited market distribution,
I don't call them "scanners". They're good for a
lot of the same things that scanners are good for,
but they're still not 'scanners'.

B. Ham/Amateur Radios: includes all ham transceivers
that have general coverage "scanning" receivers
that cover any portion of the spectrum above and
below 30 MHz. Despite the fact that these receivers
can "scan", their primary appeal is to the ham
radio community, and therefore aren't "scanners".

C. Scanners are receivers that are legally imported
into and sold within the United States. Scanners
that meet my definition of the word, cover at
least 30 MHz and up, with memory scan, band search,
priority, delay, and lockout functions, and which
are widely marketed, either by mass-merchandizing
or which are routinely advertised in a variety of
radio and electronics related publications.

D: Foreign scanning receivers of the type included in
(C) above and otherwise excluded from (A) and (B),
and which are not certified by the FCC for
importation and sale in the USA.

NOTE: I routinely support by bench testing, product
reviews, and development of modifications only
those receivers that meet my definition of
'scanners' as discussed in (C) above. While there
may be exceptions, I do not deal to any appreciable
extent with radios in any class other than (C).
Therefore, when I render an opinion or a rating of
a 'scanner', it applies exclusively to Category (C)
and does not detract from or reflect upon receivers
in Categories (A), (B, and (D). Here is why:

1. Category (A) is too expensive or too narrowly distributed or too specialized for the mainstream, typical hobbyist.

2. Category (B) is too specialized, both by specific interest communities and by law. That is, ham radios are solely for the amateur radio community, despite any appeal to other markets.

3. Category (D) is illegal in the USA for one, and two, it is very difficult or impossible to acquire service manuals and parts/repair support for receivers in this class. There is little I can do to support these radios, so I usually just ignore them, despite how "good" they may be.

4. My primary objective is to meet the technical needs of the greatest number of hobbyists and to do the most possible good and stay within the law.

==========
02: Okay. so what is the best real scanner money can buy?

Well, by the time I answer that, something new will come down to make me a liar or change my mind. I don't have a simple answer for that question, but let me try in so many words or less. It's kind of complicated, you see. I am going to discuss a handful of scanners that come close.

PRO-2004
========

My *favorite* scanner of all time is the PRO-2004, first introduced by Radio Shack in late 1986. Its market life ended in May, 1989, when the PRO-2005 replaced it. I like the PRO-2004 for its innovations, size, ease of operation and because nothing like it has come out since. Here are some of its attributes and characteristics:

Large, readable LCD display!
Sloping, tactile keypad!
All- metal (shielded) case
Large roomy interior
Modern design, even if mixed wired & SMT components
Easy to modify for more features & improved performance
Good performance, anyway, right out of the box
Triple-conversion
300/400-channels, expandable to 25,600 or more!
AGC-controlled front-end
Seven bandpass filters

Double-balanced mixers
Modularized with each major section on a separate board
Continuous coverage, 25-520 MHz & 760-1300 MHz (after cell mod)
User-selectable AM/NFM/WFM modes
User-selectable Search steps
Lock-out Review
Sound Squelch (skips dead or silent carriers & birdies)
Can be retrofitted for computer control/data acquisition
Can be made to "TrunkTrack"

I don't necessarily recommend the PRO-2004 for others anymore because it is old now and Tandy no longer supports it with spare parts and service manuals. You get one that fails and it just might stay failed. Still....I think the PRO-2004 is the finest scanner of all time, and I can fix mine when they break down.

For whatever it's worth, the PRO-2004 can be upgraded/ modified to include most of the specs of the PRO-2006.

There are two production versions of the PRO-2004, "early" and "later". You can't tell which is which by looking at the outside, nor most of the inside. The easiest way to tell is to program the Search Limits of 868.9500 to 894.0000 and if the scanner steps in 12.5-kHz increments between 868.9500 and 870.000, then it's an "early" unit. "Later" units step 30 kHz throughout this entire band.

On the inside, the CPU (IC-503) is a GRE-0327 in "early" units whereas in "later" units, it's a GRE-0327A. Obviously, "later" units are more desirable, but the older CPU can be swapped out with a newer one for the upgrade....*if* you can find one somewhere.

PRO-2006
========

My next favorite scanner of all time is the PRO-2006, also from Radio Shack, that replaced the PRO-2005 in May, 1990. The 2006 is a slightly evolved and slightly downgraded version of the PRO-2004. You will see very few differences with the schematic diagrams held side by side. Essentially, they are siblings, and almost clones. But there are differences. The differences that I don't like include:

Smaller LCD display
Vertical, rubber button keypad
Difficult access to CPU Board and LCD Display area
Smaller physical size/weight
Plastic case

Condensed, congested main board

The differences that I like include the following:

Improved Squelch circuit
Improved AM mode selectivity (has additional AM IF filter)
Faster CPU

The foregoing are pretty much the sum and total of the differences between the PRO-2004 and the PRO-2006.

Unquestionably, the PRO-2006 is the better choice for most hobbyists because Tandy still supports the 2006 with spare parts and service. That, and the 2006 is probably more reliable and less prone to failure than the 2004. So MY personal preference for the 2004 is not in any sense of the word a recommendation. It is only my preference, and largely because I can service and maintain the unit. For those who can't do that, the PRO-2006 is the hands down winner.

The PRO-2006 had an active market life from May, 1990 to roughly April, 1994, when no more units were brought into the USA, thanks to the Act of Congress that outlawed "easily cellular modifiable" scanners. New PRO-2006's surfaced for about a year, thanks to a "grandfather clause" in the TDDRA of 1994, but by the end of 1994, they were pretty much all gone.

There are two production versions of the PRO-2006. The early version has a dimmer switch for the back light. The later version has an on/off switch for the back light - no dimmer position. Also, on the rear panel, the nameplate data says "PRO-2006A" for later units. There is no other difference between the two.

PRO-2005
========

The PRO-2005 replaced the PRO-2004 in May 1989, and was replaced by the PRO-2006 a year later in May, 1990. It had a very short market life, with good reason as we will see below.

This unit doesn't rank on my list of preferences. It's essentially a PRO-2004 without the goodies. It's identical in appearance to the newer PRO-2006, but retains the slower CPU of the PRO-2004. Gone are the large LCD display; metal cabinet; and sloping tactile keypad.

It's not that I dislike the PRO-2005 - it's a darn good radio in all respects. In fact, there are few

differences among the PRO-2004/5/6, period. But when it comes to choices, the 2004 is my preferred and the 2006 is my second choice.

Aside from the physical appearances and redesign of the boards, the only difference between the PRO-2004 and 2005 is an improved AM-IF selectivity in the 2005 by virtue of an added ceramic IF filter.

The short market life of the 2005, coupled with the improved and faster PRO-2006 puts the 2005 in a unique category. If you have one, enjoy it and keep it....it's a good radio. If you don't have one, then don't get one unless it's clean and cheap.

Interesting, but the PRO-2005 can be easily upgraded to a PRO-2006 in a couple of ways. The most feasible is to replace the CPU IC-501 and Clock Resonator CX-501 with the parts for a PRO-2006, and then rewire the keyboard diode matrix DA501-DA504, to agree with how they're wired in the PRO-2006. Voile! You've got a PRO-2006 for all intents and purposes. The Logic boards are otherwise the same between the PRO-2005 and 2006. And since Tandy still stocks parts for the PRO-2006, this seems a practical approach for an upgrade.

Another way to upgrade a PRO-2005 to a 2006 is to replace the Logic and CPU Board with one for a 2006....probably the easier way.... but last I knew, Tandy wouldn't sell whole boards to the public. So to replace the CPU and CLock Resonator and rewire the diode array remains the practical approach, I guess.

The only other significant difference between the PRO-2005 and 2006 is IC-10, a CMOS bilateral switch in the Squelch circuit. This can be easily retrofitted into the PRO-2005 to complete the upgrade. The back issues of the monthly WORLD SCANNER REPORT deal with this upgrade in detail.

NOTE: It is even possible to upgrade the PRO-2004 to a PRO-2006 by grafting a 2006 CPU and Clock resonator into the 2004's Logic Board. Trouble is, the PRO-2004 used a 64-pin DIP CPU while the PRO-2005/6 use a 72-pin surface mount CPU. Still, the pin functions of all three are identical, with one unused pin in the 2004's CPU and nine unused pins in the 2005 and 2006 CPUs. The 63 pin functions of all three CPUs are identical. And, in fact, I did successfully graft a 2006 CPU into one of my PRO-2004's, but it was a job that I don't know how to translate into words to tell others how to do it.

PRO-2042 and PRO-2035
=====================

Would you believe these two fine radios are also clones of the PRO-2004/5/6 series? They are! Not exact clones, but mighty close! The PRO-2035/2042 don't have cellular capability, thanks to the TDDRA of 1994 that forbade "easy cellular modifications", and there is a whole new redesign of the boards and physical layouts, such that you'd need a schematic diagram to see the similarities of these five radios. Still, the designs are very close, and as such, the PRO-2035/2042 rank up there on the list of my favorite radios.

The only significant differences between the PRO-2042 and the older PRO-2035 are in the firmware on board the CPU. The 2042 has more conveniences than the 2035, but otherwise they are the same rig. Both are excellent radios if you can do without cellular coverage.

The so-called "cellular mods" for these two scanners are not generally worth any attention. See my SCANMOD.FAQ for details on the "VD" mod. The other "cellular" mod for the PRO-2035/2042 calls for replacement of the CPU chip (or the entire Logic/CPU board) with an unrestricted European version. Cool. Except that you pay a lot of money for 12.5 kHz steps. The "VD" mod is worthless, but if 12.5 kHz cellular steps turns you on and twitters your fritters, then go for it.

NOTES ON ALL FIVE RADIOS: PRO-2004/5/6 AND PRO-2035/2042
==

All five of these rigs are capable of some hot-shot modifications, including many thousands of extra channels of Extended Memory and Search Banks. Literally, dozens of cool mods can be done to these five radios, and among my three books and eight years of the monthly WORLD SCANNER REPORT, these rigs are well covered.

The PRO-2004/5/6 are especially accommodating of the CE-232 Scanner/ Computer Interface, a smart 2-way RS-232 controller and data acquisition interface with legendary power and capability to make scanning easier and more fun. The CE-232 Interface works in 1-way controller and AutoProgrammer mode with the PRO-2035 and PRO-2042.

See: ftp://ftp.cts.com/pub/bcheek/ce-232/ or

http://ourworld.compuserve.com/homepages/bcheek/ce-232.htm

PRO-43
======

Another member of the PRO-2004/5/6/ family and their first cousins, the PRO-2035/2042, is the handheld PRO-43. While the above five base scanners can be called 'close family', the PRO-43 isn't as close, but it is a 'second cousin'. The PRO-43 shares enough of the circuitry and specs of the Big 5 that it is one of my favorite handheld scanners....perhaps THE favorite. It is the only Radio Shack handheld GRE-made scanner to ever come with the military aero band. That feature alone is pretty awesome.

The PRO-43 is capable of many mods and hacks, including continuous coverage from about 8 MHz to 1 GHz. Yes, shortwave! Not that it works very good down that low, but the mod does unleash the force. The PRO-43 is a very cool radio and certainly the last of its kind. There are newer and snazzier handhelds out and about, but when it comes to more steak and less sizzle, the PRO-43 is hard to beat.

CAVEAT: The PRO-43A that came out around March-April of 1994 is neither cellular nor shortwave modifiable, and is not counted in the PRO-43 discussion. The PRO-43A is a good scanner, but....

The PRO-43 works with the CE-232 Scanner/Computer Interface in 1-way controller and AutoProgrammer mode.

PRO-64 and PRO-2041
==========

The PRO-64 (handheld) and PRO-2041 (base) are electronic clones of each other, (electronically identical) and what I would call 'third cousins' to the family of the PRO-2004/5/6 and PRO-2035/2042 and a first cousin of the PRO-43.

Good as these scanners are, they're even better when you consider that they come with a built in computer interface. Five bucks worth of parts and a free program lets you program these scanners with 400 channels of frequencies in about 45-seconds! Now ain't that slick! For more info, go to the following Web site:

http://www.access.digex.net/~kplotkin/scanner.htm

The PRO-64 and PRO-2041 are well covered in the monthly WORLD SCANNER REPORT, where we've found these two rigs to be eminently hackable and modifiable.

PRO-26 and BC-3000XLT
=====================

There is no relationship of the PRO-26 and BC-3000XLT to the family of the PRO-2004/5/6/203/2042/43/64/2041. That "family" was made by GRE-Japan while the PRO-26 and BC-3000XLT were made by Uniden in Taiwan. The PRO-26 and BC-3000XLT are close clones of each other, however. They are not identical, but you'd have to study their schematic diagrams for a while to spot the differences. For all practical purposes, they are alike.

Some say the BC-3000 is a little better than the PRO-26, but that's not cut and dried. These two radios are great performers and have excellent potential for mods and hacks. Forget cellular; it ain't going to happen shy of the low-rent "VD" mod or replacement of their CPUs with European versions. Neither of these so-called cell mods are acceptable in my books and they all cost a lot of money, time, and trouble for sub-par results. <Gack>

UNIDEN SCANNERS
===============

Uniden is best known for selling lots of sizzle and no steak. I know...I know, some of you don't want to hear that. Sorry, I just tell it like it is. Back in the early 80's, Uniden stopped making high quality hardware when they introduced "flatpacking" to their CB radio line (radios on a chip). Don't believe me? Look up John Leavens, formerly of CardKit Electronics, who can tell you all about how Uniden switched their philosophy of manufacturing.

Generally speaking, especially in Uniden's base scanner line, you buy firmware more so than hardware. All radios nowadays are microprocessor and firmware based, but Uniden takes this concept to the ultra max! Software is cheap compared to hardware. Not since the Muntz TV's of the 1960's have I seen such sparkling, glittering chassis on the outside and near vacuums on the inside.

Uniden has made some good radios in their time, including the BC-200XLT, BC-205XLT, BC-3000XLT, and the PRO-26. The common factor here is that these four are handheld scanners. Uniden seems incapable or unwilling to make comparable quality base scanners, though their latest offering of the BC-9000XLT might well be a sleeper. At least, it comes with more firmware frills and sizzle than any prior offering.

Uniden's TrunkTracking BC-895XLT is also connectable to a computer. I don't know how well it works, but see:

http://www.autowinnet.com/freetrack.html

In general, I don't recommend Uniden scanners. Read my lips; I don't advise against them....I just don't whoop them up. I'm not comfortable with their marketing tricks and hype. Uniden goes after the masses with a hokey glitz'n'glitter, the price of which is included in the cost of the scanner. You end up buying software, sizzle, glitz, and glamor. In my opinion, the "flank steak" is tough and you don't get much.

As usual, there are exceptions.....

THE TRUNKTRACKER SCANNERS
==========

So far, Uniden is the only manufacturer so far of TrunkTracker scanners, including the PRO-90, BC-235XLT, BC-895XLT, and now, the PRO-91 and PRO-2050. The PRO-90 and BC-235XLT are identical clones and the new PRO-2050 in a base package might well be a clone of these two. The PRO-2050 is not a clone of the BC-895XLT, despite both being base scanners.
